D (2). Artificial Respiration: A report of the survey of five years' study of devices and methods for artificial respiration has been completed and is ready for publication. However, since apparatus is seldom on hand in an emergency the Council has cooperated with the American Red Cross in educational activities promoting the manual method of artificial respiration.

E. Council on Foods and Nutrition: During the year this Council published a Handbook of Nutrition which had been prepared under its auspices. This contained the most recently available data on food values and enrichment regulations. It published also a number of reports on the nutritional value of certain foods and the effect of the addition of vitamins to them. From the public health point of view only the addition of vitamin D to milk is justified. One special report of this Council emphasizes the dangers inherent in the use of any chemical preservative in the home canning of foods. Your reference committee highly endorses the aims of this Council to encourage the production of high quality natural foods.

F. Bureau of Exhibits: Your reference committee notes the amount of work performed by the Bureau. The exhibits on fractures, burns and infectious and tropical diseases were demonstrated before many groups of our armed forces. In the selection and preservation of these films, emphasis was placed on their value to the general practitioner. There was an increased demand for motion pictures on the part of the profession. There were sent 575 pictures to 333 meetings, the chief recipients being army camps, medical schools, hospitals and county medical societies. These motion pictures, pamphlets and publications of the Bureau should be drawn to the attention of program committees of the various state societies.

G. American Health Resorts: Your reference committee knows that this committee has resumed its activities and should

become a source of much exact information to the medical profession.

Report of Reference Committee on Postwar Planning

Dr. Charles H. Phifer, Chairman, presented a report, which, as amended, reads as follows:

1. Resolutions on Creation of Committee on Medical Preparedness: Your reference committee recommends that the resolution be referred to the Committee on Military Service, which is to be appointed by the Board of Trustees, for its consideration and action.

2. Position of Surgeon General: It has been brought to the Committee's attention that the position of the Surgeon General in the armed service forces would indicate that full recognition has not been given to the Medical Department of the Army. It is the opinion of the medical profession that in order for the Medical Department to operate efficiently the Surgeon General should be on a higher level and be responsible directly to the chief of staff. Your reference committee concurs in this recommendation and asks that this be approved by the House of Delegates and a copy of the resolution be sent to the Secretary of War and the chairman of the Military Affairs Committee in the House and the Senate.

Dr. Phifer moved the adoption of the first section of the report of the reference committee, concerning Resolutions on Creation of Committee on Medical Preparedness, and the motion was duly seconded. After discussion, Dr. Phifer accepted a suggested amendment and moved the adoption of the first section of the report as amended, and the motion was seconded and carried.

On motion of Dr. Phifer, seconded and carried, the second section of the report of the reference committee, referring to the position of the Surgeon General, was adopted.

The report as a whole, as amended, was adopted on motion of Dr. Phifer, seconded and carried.

NEW BUSINESS

The Speaker resumed the chair and on motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded and carried, declared that new business would be eligible for introduction the next morning under the provisions of the report of the Reference Committee on Rules and Order of Business.

On motion of Dr. Francis F. Borzell, Pennsylvania, seconded and carried, the House recessed at 5:20 p. m. to meet at 9 a. m. Wednesday, December 5.

Third Meeting—Wednesday Morning, December 5

The House of Delegates was called to order at 9:25 a. m. by the Speaker, Dr. H. H. Shoulders.

NEW BUSINESS

Resolution on Woman's Auxiliary

Dr. Francis F. Borzell, Pennsylvania, presented the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

WHEREAS, The object of the Woman's Auxiliary is to aid the American Medical Association in every way requested; and

WHEREAS, The most urgent need at the present time is for widespread dissemination of knowledge concerning the hazards of current medical legislation; therefore, be it

Resolved, That the House of Delegates of the American Medical Association requests the Woman's Auxiliary to use every avenue possible to bring such information to its members and through them to the public.

Motion on Federal Control of Practice of Medicine

Dr. W. W. Mott, New York, presented the following motion, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

I believe that this meeting should not adjourn without fulfilling its manifest duty to our fellow citizens, in issuing to them a clear and unequivocal warning of what adoption of a system of federal control of the practice of medicine will mean to them and to their children.

The time is short, and the gates are closing, but the way is still open to them to refuse to sell their American birthright for a mess of alien pottage.

To this end I move that this House of Delegates request the Board of Trustees, through the Council on Medical Service and Public Relations, to implement this warning at once by giving it the widest possible publicity through every available medium.

Report of Reference Committee on Medical Education

Dr. Fred M. Smith, Chairman, presented the following report, which was amended and then adopted as amended on motion of Dr. Smith, seconded and carried. The amended report as adopted reads:

Telegram on Deferment of Prospective Medical Students: The Reference Committee on Medical Education recommends that the House of Delegates of the American Medical Association approve the statement in the telegram sent to Dr. Olin West by Dr. Harvey Stone and Dr. Frank H. Lahey.

Your reference committee further recommends that this resolution be approved by the House of Delegates and copies of it be wired to all members of the Senate and House Committees on Military Affairs, the director of the Office of War Mobilization and Reconversion, the director of Selective Service, the chairman of the Procurement and Assignment Service, the Secretary of War, the Secretary of the Navy and the President of the United States, and that it be given the widest publicity in the press.

Respectfully submitted,

FRED M. SMITH, Chairman.
THOMAS S. CULLEN.
GEORGE W. KOSMAK.
LEON J. MENVILLE.
A. W. ADSON.

Report of Reference Committee on Industrial Health

Dr. William L. Estes Jr., Chairman, presented the following report, which on motions of Dr. Estes, duly seconded and carried, was adopted section by section and as a whole:

1. Report of Board of Trustees Dealing with Report of Council on Industrial Health: The magnificent report of the Council on Industrial Health has received detailed consideration by your reference committee. Its comprehensive coverage of industrial health activities indicates the wise direction and thorough understanding and foresighted vision of those responsible for the work of this council and full realization of the opportunities and obligations of the profession in this ever expanding field of medical endeavor. Your reference committee would particularly commend (1) its belief in the importance of the Council's role in the development and maintenance of satisfactory scientific and cultural relations with Canada and Latin America; (2) that in health activities in industry the physician should be directly responsible to top management and that activities relating to health in industry be centered in and directed through the medical department, and in that connection your reference committee would particularly advise that adequate supervision by the industrial physician be considered imperative.

Your reference committee concurs in the Council's opinion that public industrial hygiene activity should reside in bureaus operated by health departments and that the services performed by these bureaus, the Division of Industrial Hygiene of the U. S. Public Health Service and similar divisions of state and local health departments merit full support of the medical profession.

The formulation of a joint committee of the Council on Medical Education and Hospitals and the Council on Industrial Health seems particularly timely to survey the field of undergraduate teaching in the field of industrial medicine, to encourage refresher courses for physicians and to foster graduate teaching in industrial health to the end that a sound foundation may be laid for the possible eventual recognition of this division of medicine as a specialty.

Your reference committee particularly commends concern for and interest in the return of many disabled persons to profitable employment whereby physical capacity is matched with specific

occupational requirements. It is a matter of gratification that the Council feels one of its most significant contributions to the whole industrial health problem lies in continued study of the rehabilitation problem and the field of industrial health examination.

It is worthy of note that the Committee on Workmen's Compensation of the Council stands ready with dependable aid and guidance in workmen's compensation affairs for state medical associations.

The enlarging scope of the activities of the Council would seem to deserve generous consideration in the amplification of funds allocated to the Council in order to obtain adequate personnel and facilities for the important expansion program in contemplation particularly in field services.

In conclusion, the committee concurs heartily in the belief of the Council on Industrial Health that in no other field are there comparable opportunities to improve scientific medicine and the distribution of medical services and to awaken a real appreciation of the accomplishments of medicine on the part of a very large portion of the total population.

2. Resolutions on Opposition to H. R. 525 and S. 1271: Your reference committee approves these resolutions, recommends their adoption and further recommends that copies of them be sent through proper channels of the American Medical Association to the appropriate committees of Congress.

Respectfully submitted,

WILLIAM L. ESTES JR., Chairman.
OLIVER W. H. MITCHELL.
STANLEY H. OSBORN.
DWIGHT H. MURRAY.
JAMES Q. GRAVES.
JAMES P. KERBY.
BARNEY J. HEIN.

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. Carl R. Steinke, Chairman, presented the following report:

1. Proposed Amendments to By-Laws, Chapter XV: In order to make effective the recommendation of the Council on Scientific Assembly creating a Section on General Practice, which recommendation has received the approval of this House, the following amendments to the By-Laws are hereby proposed: Change Section 1 "Titles of Sections of Scientific Assembly," No. 1 to read "Internal Medicine" and change No. 17 to No. 18 and insert a new No. 17 to read "General Practice of Medicine."

Your Reference Committee on Amendments to the Constitution and By-Laws approves of this change in the By-Laws.

2. Supplementary Report of the Council on Scientific Assembly: Your reference committee recommends approval of this report which requests changes in the By-Laws, chapter XV, referring to the sections.

3. A Plan Whereby Medical Students of Approved Medical Schools Can Become Student Members of the American Medical Association: Your reference committee recommends approval of the report of the Board of Trustees in this matter.

4. Resolution on Admission of Medical Staff of Veterans Administration to Fellowship in Association: The resolutions proposing amendments to the Constitution and By-Laws referring to the granting of Fellowship to medical officers of the Veterans Administration, which were referred to the Board of Trustees last year, were given consideration by the Board and were referred by it to the Judicial Council, reported on to the Board of Trustees and by that body referred to the House of Delegates. Your reference committee recommends that in view of the impending reorganization of the Veterans Administration no new policy be adopted until that reorganization is complete.

5. Supplementary Report of Council on Medical Service and Public Relations Dealing with Fellowship: The report of the reference committee on this matter was submitted to the House.

Respectfully submitted,

CARL R. STEINKE, Chairman.
KARL S. J. HOELEN.
THOMAS A. FOSTER.
GEORGE P. JOHNSTON.
ROSS S. McELWEE.

The Vice Speaker took the chair.

The first, third and fourth sections of the report of the reference committee were adopted on motions of Dr. Steinke, seconded and carried after discussion. The second and fifth sections were referred to the reference committee.

The By-Laws were then amended in accordance with section 1 of the report of the reference committee on motion of Dr. Steinke, seconded and carried.

The Speaker resumed the chair.

Executive Session

The House went into Executive Session on motion of Dr. Arthur J. Bcdell, Section on Ophthalmology, seconded and carried.

The Sergeant-at-Arms cleared the House of all but those entitled to remain, and the Speaker declared the House in Executive Session.

Report of Reference Committee on Executive Session

Dr. Walter F. Donaldson, Chairman, presented the following report, which on motion of Dr. Donaldson, seconded and carried after discussion, was adopted:

Resolution on Council on Medical Service and Public Relations and Amendment: Your reference committee has reconsidered the original resolution and has considered the amendment to the original motion submitted to the House of Delegates.

The duties of the Council on Medical Service and Public Relations as outlined in the By-Laws have been reviewed. Your reference committee reviewed the manifold duties of this council as outlined on pages 165 to 180 in the Handbook.

Your reference committee feels that this council is already overwhelmed with work assigned to it that more properly belongs to other committees. Furthermore it believes that this council has done excellent work to date and is to be commended. It feels that the Board of Trustees should clarify the duties of this council. There is evidence that the Council will be assisted materially when the Bureau of Medical Economics is revived.

Your reference committee has been informed that provision has been made by the Board of Trustees to engage public relations counsel.

For the foregoing reasons your reference committee believes that it is unwise to add to the duties of the Council at this time. It further believes that, in the interest of harmony and at such a critical time in American medicine, this is a most inopportune time to consider such resolutions and amendments.

Your reference committee has complete confidence in the Board of Trustees to carry this matter to a successful conclusion. It feels therefore that, for the reasons outlined in the original report of the committee and those outlined here, the resolution and amendments should be disapproved.

Respectfully submitted,

WALTER F. DONALDSON, Chairman.
EDWARD JELKS.
JAMES R. McVAY.
WILLIAM R. BROOKSHER.
THOMAS P. MURDOCK.
CLARK BAILEY.
ALLEN H. BUNCE.

Report of Reference Committee on Legislation and Public Relations

Dr. E. S. Hamilton, Chairman, presented the amended portion of the report of the reference committee on the message of President Truman, which was adopted on motion of Dr. Hamilton, seconded and carried. The report of the reference committee on the message of President Truman as amended and finally adopted reads:

Assigned to the Committee on Legislation and Public Relations was the message of President Harry Truman, submitting a national health program on November 19 and the latest version of the Wagner-Murray-Dingell bill submitted to the Senate and the House of Representatives the same day.

The President's program includes five features: The first is the proposal to grant federal aid for the building of hospitals and health centers throughout the nation. The Board of Trus-

tees of the American Medical Association has approved the principles of the Hill-Burton bill, and the committee recommends that the House of Delegates endorse this action of the Board as being within the program of constructive action toward improving the health of the American people.

The second recommendation of President Truman is for an extension of maternal and child health services. The Wagner-Murray-Dingell bill would make this effective by increased grants in aid through the Children's Bureau to the individual states. This constitutes an insidious attempt to turn over to the federal government functions that are definitely those of the medical profession. The American Medical Association has always favored proper aid for the extension of maternal and child health services where the need can be shown.

The third feature of the President's message dealt with the development of the National Research Foundation. The Committee on Postwar Medical Service, the Council on Medical Education and Hospitals and the Board of Trustees of the American Medical Association have approved the principles of the Magnuson bill, which would place the control of the National Research Foundation under a scientific board of directors rather than under an individual director to be appointed by the President. Your reference committee approves the action taken by those official bodies of the American Medical Association and urges that the House of Delegates support their recommendations.

Finally, the fourth proposal of President Truman and the main feature of the Wagner-Murray-Dingell bill is the creation of a federal system of compulsory sickness insurance. In commenting on this proposal, your reference committee recommends that the House of Delegates endorse the following statement from the editorial published in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*, Dec. 1, 1945: "No one will ever convince the physicians of the United States that the Wagner-Murray-Dingell bill is not socialized medicine. By this measure the medical profession and the sick whom they treat will be directly under political control. By this measure the great system of private hospitals and community hospitals that have grown up in our country will depend for their continued operation on funds paid to them by a federal government agency. By this measure the philanthropic efforts for the care of the sick, which have been the pride of our nation, will be forever deterred. Through this measure competent young men who would enter the medical profession will be forced to seek other fields of action still remaining under our democracy which still permit the exercise of individual initiative and freedom of thought and action. By this measure doctors in America would become clock watchers and slaves of a system. Now, if ever, those who believe in the American democracy must make their belief known to their representatives, so that the attempt to enslave medicine as first among the professions, industries and trades to be socialized will meet the ignominious defeat it deserves."

Your reference committee recommends that the House of Delegates express its official disapproval of section 4 of the Wagner-Murray-Dingell bill for the following reasons:

1. The Wagner-Murray-Dingell bill is founded on the false assumption that solution of the medical care problem for the American people is the panacea for all of the troubles of the needy.

2. This is the first step in a plan for general socialization not only of the medical profession but of all professions, industry, business and labor.

3. Positive proof exists from experience in other countries that inferior medical service results from compulsory health insurance.

4. A program such as outlined is enormously expensive. It will result in greatly increased taxes for the entire population of the United States.

5. Voluntary prepayment medical plans now in operation in many parts of the United States and which are rapidly increasing in number will accomplish all the objects of this bill with far less expense to the people and under these plans the public will receive the highest type of medical care.

On motion of Dr. Mather Pfeifferberger, Illinois, seconded by Dr. E. V. Askey, California, and carried, the House rose from Executive Session, and on motion of Dr. R. W. Fouts, Nebraska, seconded and carried, the House went into regular session.

Wednesday Morning—Continued

Introduction and Address of Dr. Thomas C. Routley

Dr. Roger I. Lee, President, introduced Dr. Thomas C. Routley, Toronto, Canada, Secretary of the Canadian Medical Association, who addressed the House as follows:

Mr. President, Mr. Speaker, and Members of the House of Delegates: I deem it a rare privilege from year to year to be permitted to attend your sessions and meet you and say a word to you. I began my autumn tour of Canada in September and traveled some ten or twelve thousand miles, returning to my office two or three days ago. When I received Olin West's very kind note reminding me that you were meeting this week, I couldn't resist the temptation to come. As a matter of fact, I don't see how you fellows got along for the last two days without this perennial visitor from Canada.

I can see from the discussions this morning that you have problems just as we do. In fact, it reminds me of a story. One of our Canadian boys was sight-seeing in London and as he was raised in the vernacular of modern youth his language was punctuated with plenty of slang. He was standing in front of a building looking up at it when an Englishman came along, and he said to the Englishman "Say, bo, what is that?"

He said "That is our crenatorium."

"Cripes," he said, "is that where they make cheese?"

"No, no, no," said the Englishman, "That isn't where they make cheese." He said "Why don't you go in and have a look around? It is quite an interesting building."

So the boy went in and in less time than it takes to tell it he landed out again on the sidewalk on all fours. The Englishman, who hadn't moved, said "Well, my boy, what happened to you?"

"Cripes," he said, "I don't know what happened to me. I went in there and I saw a lot of sourpusses over in the corner looking pretty gloomy, so I went over and I said 'Well, boes, what's cooking?'"

Well, listening to our discussions and reading your morning's paper, as I said, I realized there is plenty a-cooking and we in medicine, both over here and in Canada, have need to be on our guard. While on my feet, I would ask if I may be permitted to say one or two things.

In the first place, we have just decided this week to hold our seventy-seventh annual meeting in Banff Springs Hotel in the mountains. Many of us know that glorious spot. We are meeting during the week of June 10, and I here and now on behalf of the Canadian Medical Association extend a hearty welcome to any and all of you and your colleagues who can find it convenient to visit us in Banff during the week of June 10. It is on your way to San Francisco, a glorious stop, and we will try to be as kind to you as you have always been to me and my colleagues when we come here.

There is one other thing that I would like to say if I may. The world has emerged from this war, thank God, but I am not sure that the war is entirely over. The shooting is over but the peace is far from being fully realized and we are not going to have a peaceful world unless the United Nations undertakes to make the peace stick. And, gentlemen, we are not going to have united nations unless we have united understanding and good will and cooperation, and the reason we have such marvelous good will and cooperation and understanding between your country and mine is the fact that we see each other. We meet each other. We know each other, and we love each other.

Now is it possible that in the great company of nations something like that can be achieved? It can be achieved only by bringing the people of the United Nations together. Therefore, we in Canada a few days ago proposed to our government

that the government of Canada invite the United Nations to convene its first medical congress of the United Nations in our country.

I would like to suggest, if I may, Mr. Speaker, without presumption, that perhaps this great body would feel disposed to support an invitation to the steering committee of the United Nations now sitting in London, suggesting that a medical conference of all the United Nations be convened some time in the next year on this side of the water. If you felt you could support the idea of their being convened at some convenient center in Canada, we of course would be delighted on our side to have that support.

I have no knowledge whatever that the United Nations Council would consider favorably such an invitation, but I have a feeling that, should that invitation be supported by American medicine to the fullest extent of the term, by your body and ourselves, perhaps the invitation might be favorably received.

Mr. Speaker, may I once again express to you my profound sense of happiness and satisfaction in being received by you as I have been so cordially for now twenty-three years. I trust that the relationship which exists between our two bodies will be a signpost to medicine throughout the world so that we here in medicine on this continent may do our share to make the United Nations united and to insure that peace will be here to stay.

On motion of Dr. R. E. Schlener, Missouri, seconded by Dr. George W. Kosmak, New York, and carried, the request of Dr. Routley for the support of the American Medical Association in inviting a medical conference of all united nations to be convened some time next year in Canada was referred to the Board of Trustees with power to act.

Report of Reference Committee on Miscellaneous Business

Dr. James R. Reuling Jr., Chairman, presented the following report, which on motion of Dr. Renling, duly seconded and carried, was adopted section by section:

1. Resolution on National Physicians' Committee. Your reference committee approves the resolution and moves its adoption by the House.

2. Resolution on Removal of Sex Discrimination from Medical Students: Your reference committee is in sympathy with the intent of the resolution. However, recognizing that the admission requirements of the various medical schools are entirely a matter for the trustees and the admissions committees of the various medical schools, it is recommended that the Secretary of the American Medical Association be requested to refer this resolution to the Association of American Medical Colleges without comment.

Respectfully submitted,

JAMES R. REULING JR., Chairman.
STEPHEN E. GAVIN.
HENRY A. LUCE.
L. W. LARSON.
WILLIAM BATES.

Dr. Reuling moved that the Resolutions on Minimum Wage Standard, which had been tabled yesterday, be taken from the table, and the motion was seconded and lost.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Thomas A. McGoldrick, Chairman, presented the following report, which on motions of Dr. McGoldrick, duly seconded and carried, was adopted section by section:

1. Resolution on Woman's Auxiliary: Your reference committee recommends that the House of Delegates approve this resolution.

2. Motion on Federal Control of Practice of Medicine: Your reference committee recommends that the House of Delegates approve this motion.

Proposed Amendment to the By-Laws, Chapter XII, Section 2

Dr. L. S. Goin, California, submitted the following proposed amendment to the By-Laws, chapter XII, section 2, which was

referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Resolved, That section 2 of chapter XII of the By-Laws be amended by striking the words "and subscribe to THE JOURNAL," and further amend section 2, chapter XII, by inserting after the words "is disapproved by the Judicial Council (line 8, p. 30) a new sentence to read "Fellows shall receive THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION."

The House recessed for fifteen minutes, after which it was called to order by the Speaker, Dr. H. H. Shoulders.

Report of Reference Committee on Legislation and Public Relations

REPORT OF BUREAU OF LEGAL MEDICINE AND LEGISLATION TO BOARD OF TRUSTEES

1. Chemical Tests for Intoxication: The Board of Trustees approved in principle the draft, in form of an amendment of the Uniform Vehicle Code, a copy of which appears on page 69 of the Handbook. Your reference committee recommends similar approval by the House of Delegates.

2. Prescribing Narcotics by Telephone: Your reference committee concurs in the recommendation of the Board of Trustees that physicians restrict orders for narcotics by telephone to actual cases of emergency.

3. Industrial Health Under Jurisdiction of Labor Department (H. R. 525): A resolution covering this subject was introduced and referred to the Reference Committee on Industrial Health. Your reference committee presents no report.

4. Miller Bill to Establish a Federal Department of Health: A resolution also covering this subject was referred to another committee. Your reference committee presents no report.

5. Federal Licensure of Physicians: This matter is also covered in another resolution. Your reference committee presents no report.

6. The Wagner-Murray-Dingell Bill (S. 1050): This bill has been superseded by S. 1606, which is discussed in another part of the report of this reference committee.

7. Maternal and Child Welfare Act of 1945 (S. 1318): The detailed analysis of the provisions of this legislation was published in the Aug. 11, 1945 issue of THE JOURNAL. The bill would extend and greatly expand the E. M. I. C. program. It would make available to mothers and children medical care irrespective of financial needs. A "child" in contemplation of this legislation is any person under 21 years of age. Your reference committee recommends disapproval of the bill.

8. Committee to Study the Relationship of Medicine and the Law: Your reference committee approves the report of this committee.

9. Federal Programs to Promote Scientific Research: This matter is also considered in another resolution. Your reference committee presents no report.

10. Deferment of Premedical Students: A resolution covering this subject was referred to another committee. Your reference committee presents no report.

REPORT OF COUNCIL ON MEDICAL SERVICE AND PUBLIC RELATIONS

1. Section on Public Relations: Your reference committee desires to commend the splendid work that has been done during the past year. It desires to emphasize the importance of utilizing all dignified approaches to the public by which the public may have a clear knowledge of the work of organized medicine. Community health conferences have proved valuable in numerous sections of the country. The utilization of professional public relations counsels on a national, state and county level is approved:

2. Medical Care for the American People: Your reference committee has reviewed the article by Dr. Louis H. Bauer published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, Dec. 1, 1945. It commends the excellent manner in which the program of the physicians represented by the American Medical Association dealing with the extension of improved health and medical care to all the people is presented. It recommends that the article be generally read by the profession.

Your reference committee stresses especially section 1 of the program dealing with sustained production leading to better living conditions, improved housing, nutrition and sanitation which are fundamental to good health; section 4, dealing with the development in or extension of voluntary sickness insurance plans; section 7, dealing with federal aid to states where definite need is demonstrated, administered on a state basis with the help and advice of the medical profession; section 10, dealing with discharge of physicians from the armed forces as rapidly as is consistent with the war effort; section 12, dealing with adoption of federal legislation to provide for adjustments in draft regulations which will permit students to prepare for and continue the study of medicine, and section 12, dealing with postponement of consideration of revolutionary changes while such a large number of medical men are in the service and while such a large number of men and women are in uniform. The Vice Speaker took the chair.

3. Published and Interim Reports of the Council: Your reference committee has carefully reviewed these reports. Much praise should be given this council for its earnestness and zeal in facing a most difficult assignment. It believes that the news letter and special bulletins issued have been of great value in arousing and maintaining interest in the various component societies. The studies already made in the field of voluntary insurance will be increasingly valuable.

The recommendation on service fellowships is heartily approved.

The establishment of the Washington office is a distinctly forward step, and its published report should be carefully read by every member of the profession.

The several regional conferences conducted by the Council as well as the many addresses delivered by individual members of the Council deserve great praise.

The Council is to be congratulated on the employment of Mr. Cooley and the highly competent advisory and consulting committees.

In its supplementary report the Council again calls attention to its studies on the status of medical students, with the recommendation that the House of Delegates request state and county medical societies to implement methods as early as possible for the admission of medical students to county societies in order that they may be inculcated with the ideals and ethics of medicine. This recommendation is approved.

The Council calls attention in the supplementary report to the fact that it has held numerous conferences with the American Cancer Society, in which meetings recommendations were made as to changes in certain of its rules and objectives. The Council recommends that the House of Delegates approve the following standards taken from these resolutions: (a) Definition: A cancer detection, cancer prevention, well person clinic is designed to detect abnormalities not producing symptoms sufficient to send the patient to the doctor. These clinics do not diagnose or treat diseases; (b) no such clinics shall be established in any community without the approval of the county medical society.

Your reference committee recommends approval of this recommendation.

REPORT OF COUNCIL ON MEDICAL SERVICE AND PUBLIC RELATIONS ON VOLUNTARY PREPAYMENT MEDICAL CARE PLANS, RESOLUTION ON DEVELOPMENT OF SPECIFIC NATIONAL HEALTH PROGRAM AND RESOLUTIONS ON EXPANSION OF MEDICALLY SPONSORED VOLUNTARY GROUP HEALTH CARE PROGRAMS

Your reference committee has reviewed several resolutions calling for the adoption of voluntary prepayment medical care plans. All of these plans show a uniformity of desire for the immediate setting up of a national plan on a voluntary basis. In all of them the urgency of this being done is stressed. Accordingly your reference committee recommends that the House of Delegates of the American Medical Association instruct the Board of Trustees and the Council on Medical Service and Public Relations to proceed as promptly as possible with the development of a specific national health program, with emphasis on the nationwide organization of locally administered prepayment medical plans sponsored by medical societies.

The Speaker resumed the chair

RESOLUTIONS ON CHANGE OF SYSTEM OF MEDICAL CARE

Your reference committee has already gone on record as favoring the article by Dr. Louis H. Bauer in *THE JOURNAL*, December 1, page 945, and it recommends at this time that this resolution be approved.

RESOLUTION ON PERMANENT CONFERENCE ON MEDICAL CARE

Your reference committee feels that it is unnecessary to take any action at this time and respectfully refers the resolution to the Board of Trustees and to the Council on Medical Service and Public Relations for consideration and attention.

RESOLUTIONS ON WILLINGNESS TO COOPERATE IN NATIONAL CONFERENCE OF LABOR

Your reference committee is informed that this attempt has been previously made by both the Board of Trustees and the Council on Medical Service and Public Relations with little success. It accordingly returns this to them for any further action that they deem necessary.

H. R. 4717

Your reference committee believes that this resolution was prepared and presented before the House had the opportunity of hearing the brilliant address by Major General Hawley, and that, in view of the pronouncements made by Major General Hawley, no action at this time is necessary.

REPORT OF COUNCIL ON MEDICAL SERVICE AND PUBLIC RELATIONS ON LEGISLATION

Your reference committee is heartily in accord with the sentiment expressed in this report.

MIDWINTER SESSION OF HOUSE OF DELEGATES

Dr. Hamilton asked if any report had been submitted regarding the suggestion of the President for midwinter meetings of the House in addition to the annual session and was advised that no such report had as yet been submitted.

Dr. Hamilton then reported that the Board of Trustees suggested that, if two meetings of the House should be held each year, that would undoubtedly obviate the necessity for any action regarding the delegating of powers of the House of Delegates to the Board of Trustees.

Your reference committee approves this in principle and recommends that the proper By-Law for two meetings a year of the House of Delegates be prepared for introduction and consideration by the House of Delegates at its next meeting, July 1946.

RESOLUTIONS ON LICENSURE OF HONORABLY DISCHARGED MEDICAL OFFICERS WITHOUT EXAMINATION AND RESOLUTION ON OPPOSITION TO H. R. 2969

Your reference committee is strongly of the opinion that licensing of physicians is a state right and as such it does not come within the province of the House of Delegates of the American Medical Association to make any such recommendations to the state legislature. Your reference committee recommends disapproval of the Resolutions on Licensure of Honorably Discharged Medical Officers Without Examination and approval of the Resolution on Opposition to H. R. 2969.

Respectfully submitted,

E. S. HAMILTON, Chairman.
JOHN J. MASTERSON.
EDWARD L. BORTZ.
RAYMOND L. ZECH.
LLOYD NOLAN.

Dr. Hamilton moved adoption of each section of the report of the reference committee dealing with the Report of the Board of Trustees on the Bureau of Legal Medicine and Legislation, and each motion was duly seconded and carried after discussion.

On motions of Dr. Hamilton, seconded and carried after discussion, the report of the reference committee referring to the Report of the Council on Medical Service and Public Relations was adopted section by section

It was moved by Dr. Hamilton that the report of the reference committee concerning resolutions dealing with voluntary prepayment medical care plans be adopted. The motion was seconded by several and carried.

On motion of Dr. Hamilton, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried, the report of the reference committee, referring to Resolutions on Change of System of Medical Care was adopted.

Dr. Hamilton moved that the section of the report of the reference committee concerning the Resolution on Permanent Conference on Medical Care be adopted. The motion was seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried.

It was moved by Dr. Hamilton, seconded by Dr. Charles H. Phifer, Illinois, and carried that the portion of the report of the reference committee dealing with Resolutions on Willingness to Cooperate in National Conference of Labor be adopted.

Dr. Hamilton moved, and the motion was seconded and carried, that the section of the report of the reference committee with respect to H. R. 4717 be adopted.

On motion of Dr. Hamilton, seconded and carried, the part of the report of the reference committee pertaining to the report of the Council on Medical Service and Public Relations on Legislation was adopted.

Dr. Hamilton moved that the report of the reference committee on Midwinter Session of House of Delegates be adopted. The motion was seconded and carried.

The Speaker declared it unnecessary to amend the By-Laws as suggested by Dr. Hamilton to provide for two sessions of the House of Delegates because interim sessions can now be called by the Speaker on written request of twenty-five or more of the delegates representing one third or more of the constituent associations or on request of a majority of the Board of Trustees.

Dr. Hamilton moved, and the motion was seconded by Dr. Charles H. Phifer, Illinois, and carried after discussion, that the report of the reference committee dealing with resolutions on licensure of honorably discharged medical officers and the resolution on opposition to H. R. 2969 be approved.

Report of the Reference Committee on Rules and Order of Business

Dr. Francis F. Borzell, Chairman, presented the following report:

In view of the fact that the business of the House is not yet completed, and also in view of the fact that this House moved yesterday to have the election at 2 o'clock this afternoon, I move that the business of the morning be suspended temporarily; that we reconvene at 2 o'clock; that at the conclusion of the election this afternoon we consider again the order of business of this morning that has not yet been completed, and that then, if necessary, the House continue on into the evening. I have been told that this room will be available so that we may then complete our business today.

That means that this afternoon's session would constitute the last session of the House of Delegates, and your attention is called by the Reference Committee on Rules and Order of Business to a provision in the By-Laws which provides that new business to be presented at the last session requires unanimous consent for introduction and all such business so presented requires three-fourths affirmative vote for adoption. The business of the House, therefore, would be expedited in the last session.

Dr. Mather Pfeifferberger, Illinois, moved that the House recess for luncheon.

The motion was seconded, was put to a vote, and was carried, and the meeting recessed at 1 o'clock.

Wednesday Afternoon, December 5

The House of Delegates was called to order at 2:10 p. m. by the Speaker, Dr. H. H. Shoulders.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, announced that 170 delegates had registered for this session of the House.

Roll Call

Dr. Olin West, Secretary, called the roll.

Presentation of Minutes

On motion of Dr. William R. Brooksher, Arkansas, seconded and carried, the House dispensed with the reading of the minutes.

Resignation of the Speaker, Dr. H. H. Shoulders

Dr. H. H. Shoulders, Speaker, offered his resignation as Speaker of the House of Delegates. It was moved by Dr. James R. Reuling Jr., New York, seconded by Dr. George W. Kosmak, New York, and carried after amendment, that the resignation be accepted with regret and with due appreciation of services to this House.

ELECTION OF OFFICERS

The Speaker declared the next order of business to be the election of officers.

Election of President-Elect

The Vice Speaker assumed the Chair and called for nominations for President-Elect.

Dr. A. R. McComas, Missouri, nominated Dr. Alphonse McMahon, St. Louis, and the nomination was seconded by Drs. Robert E. Schlueter, Missouri; Clark Bailey, Kentucky, and Thomas A. McGoldrick, New York.

Dr. H. B. Everett, Tennessee, nominated Dr. H. H. Shoulders, Nashville, Tenn., and the nomination was seconded by Drs. Stephen E. Gavin, Wisconsin; Louis A. Buie, section on Gastro-Enterology and Proctology; Olin H. Weaver, Georgia; Francis F. Borzell, Pennsylvania; Robert H. Hayes, Illinois; Floyd S. Winslow, New York, and Thomas A. Foster, Maine; the delegation from New Jersey, and Drs. Emily D. Barringer, New York; William R. Brooksher, Arkansas; James Q. Graves, Louisiana, and Lloyd Noland, Alabama.

Dr. Barney J. Hein, Ohio, nominated Dr. E. J. McCormick, Toledo, Ohio, and the nomination was seconded by the delegation from Connecticut.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the nominations be closed, and the motion was seconded by Dr. E. G. Wood, Tennessee, and carried.

Dr. Olin West, Secretary, announced that 150 delegates had answered the roll call. Three additional delegates reported in attendance.

The Tellers spread the ballot and the Secretary announced that 153 delegates had reported present and 149 votes had been cast, of which Dr. McMahon had received 21, Dr. Shoulders 77 and Dr. McCormick 51.

The Vice Speaker declared Dr. H. H. Shoulders, Nashville, Tenn., having received the majority of the votes cast, elected President-Elect.

Dr. A. R. McComas, Missouri, moved that Dr. Shoulders be declared elected unanimously, and the motion was seconded and carried.

The Vice Speaker appointed Dr. James R. Reuling Jr., New York, and Dr. H. B. Everett, Tennessee, to escort the newly elected President-Elect, Dr. H. H. Shoulders, to the platform.

Election of Vice President

Dr. Charles H. Phifer, Illinois, nominated for Vice President Dr. E. S. Hamilton, Kankakee, Ill., and the motion was seconded by Dr. Thomas F. Thornton, Iowa. Dr. A. A. Walker, Alabama, stated that since Dr. Hamilton was a member of the House of Delegates he was not eligible for election as Vice President according to the By-Laws, and the Vice Speaker read that section of the By-Laws, after which Dr. Phifer withdrew his nomination of Dr. Hamilton.

Address of President-Elect

Dr. H. H. Shoulders, President-Elect, was escorted to the platform and addressed the House as follows:

Some years ago I served with you as a member of this House of Delegates. Then I developed a respect for the members

of this House, as well as a profound regard for the heavy duties you performed. You later elevated me to Speaker in the House, and my respect for you and your responsibility has grown with the years.

Today I do not know how to express to you my profound sense of gratitude for the honor you have conferred on me, but I will say this: So help me God, I will endeavor to fulfil the office so as not to embarrass you.

I thank you.

Election of Vice President

Dr. A. A. Walker, Alabama, nominated Dr. W. R. Molony, Los Angeles, and the nomination was supported by several. Dr. Mather Pfeifferberger, Illinois, moved that the nominations be closed and that the ballot be cast for Dr. Molony. The motion was seconded by several and carried.

Dr. Olin West, Secretary, cast the vote of the House for Dr. W. R. Molony, Los Angeles, for Vice President for the ensuing year, and the Vice Speaker declared Dr. Molony so elected.

Election of Secretary

Dr. A. A. Walker, Alabama, nominated Dr. Olin West as Secretary to succeed himself, and the motion was seconded by several. Dr. James R. Reuling Jr., New York, moved that the nominations be closed and a rising vote be taken, and the motion was seconded by several and carried.

The rising vote was unanimous and the Vice Speaker declared Dr. Olin West elected Secretary of the American Medical Association for the ensuing year to succeed himself.

It was moved by Dr. Stanley H. Osborn, Section on Preventive and Industrial Medicine and Public Health, that the vote be by one ballot to conform to the legal requirements, and the motion was seconded and carried.

Dr. R. W. Fouts, Vice Speaker, took great pleasure in casting the ballot of the House for Dr. Olin West as Secretary of the American Medical Association for the ensuing year and declared Dr. West so elected.

Election of Treasurer

Dr. James R. Bloss, Chairman, Board of Trustees, reported as follows: The Board would like to submit the name of Dr. Josiah J. Moore, Chicago, to succeed himself as Treasurer of the Association.

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded and carried, the nomination of Dr. Moore was supported.

Dr. Olin West, Secretary, cast the vote of the House for Dr. Josiah J. Moore as Treasurer of the American Medical Association for the ensuing year and the Vice Speaker declared Dr. Moore so elected.

Election of Speaker of House of Delegates

The Vice Speaker requested the President, Dr. Roger I. Lee, to take the chair.

Dr. Karl S. J. Holten, Nebraska, nominated Dr. R. W. Fouts, Omaha, as Speaker of the House of Delegates, and the nomination was seconded by several, after which it was moved, seconded and carried that the nominations be closed.

On motion of Dr. Mather Pfeifferberger, Illinois, seconded and carried, Dr. Olin West, Secretary, cast the vote of the House for Dr. R. W. Fouts, Omaha, as Speaker of the House of Delegates of the American Medical Association for the ensuing year, and the Acting Speaker, Dr. Roger I. Lee, declared Dr. Fouts so elected.

Dr. R. W. Fouts, Speaker, resumed the chair.

Election of Vice Speaker of House of Delegates

Dr. Walter F. Donaldson, Pennsylvania, nominated Dr. Francis F. Borzell, Philadelphia, as Vice Speaker of the House of Delegates, and the nomination was supported by several.

It was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, that the nominations be closed. The motion was seconded and carried after the nomination of Dr. James R. Reuling Jr., Bayside, N. Y., by Dr. Floyd S. Winslow, New York.

Dr. Reuling requested the privilege of withdrawing his name from nomination and moved that one unanimous vote be cast for Dr. Borzell. The motion was seconded and carried.

Dr. R. W. Fouts, Speaker, cast the ballot of the House for Dr. Francis F. Borzell, Philadelphia, as Vice Speaker of the House of Delegates of the American Medical Association for the ensuing year and declared Dr. Borzell so elected.

Election of Trustees

ELECTION OF TRUSTEE TO SUCCEED

DR. RALPH A. FENTON

Dr. James M. Flynn, New York, nominated Dr. John H. Fitzgibbon, Portland, Ore., as Trustee to succeed Dr. Ralph A. Fenton, Portland, Ore., whose term as Trustee expires this year and who is not eligible for reelection. The nomination was supported by several.

On motion of Dr. A. A. Walker, Alabama, seconded and carried, the nominations were closed and the Secretary was instructed to cast the vote of the House for Dr. Fitzgibbon.

Dr. Olin West, Secretary, cast the ballot of the House for Dr. John H. Fitzgibbon, Portland, Ore., to serve as Trustee of the American Medical Association for a term of five years, and the Speaker declared Dr. Fitzgibbon so elected.

ELECTION OF TRUSTEE TO SUCCEED DR. JAMES R. BLOSS

Dr. J. Morrison Hutcheson, Virginia, nominated Dr. Walter B. Martin, Norfolk, Va., as Trustee to succeed Dr. James R. Bloss, Huntington, W. Va., whose term expires this year and who is not eligible for reelection.

Dr. Walter G. Phippen, Massachusetts, nominated Dr. James A. Miller, Hartford, Conn., and the nominations of Dr. Martin and Dr. Miller were seconded by several.

Dr. Mather Pfeifferberger, Illinois, moved that the nominations be closed, and the motion was seconded and carried.

The tellers spread the ballot and Dr. Olin West, Secretary, announced that 146 votes had been cast, of which Dr. Martin received 47 and Dr. Miller 99, and the Speaker declared Dr. James R. Miller, having received the majority of the votes cast, elected Trustee to succeed Dr. James R. Bloss for a term of five years.

ELECTION OF TRUSTEE TO COMPLETE THE UNEXPIRED

TERM OF DR. EDWARD M. PALLETTE, DECEASED

Dr. Louis A. Buie, Section on Gastro-Enterology and Proctology, nominated Dr. Robert A. Peers, Colfax, Calif., to succeed himself serving in place of Dr. Edward M. Pallette, deceased.

Dr. L. S. Goin, California, nominated Dr. Dwight H. Murray, Napa, Calif., and the nomination was seconded by several.

Dr. E. H. Cary, Texas, nominated Dr. Stanley J. Seeger, Texarkana, Texas, and the nomination was seconded by Dr. James C. Sargent, Wisconsin.

It was moved, seconded and carried that the nominations be closed and the Tellers spread the ballot.

Dr. Olin West, Secretary, announced that 142 votes had been cast, of which Dr. Peers received 34, Dr. Murray 70 and Dr. Seeger 38. The Speaker declared that the name of Dr. Peers, having received the least votes, would be removed from the ballot, and the Tellers spread a second ballot.

Dr. Olin West, Secretary, stated that 126 votes were cast, of which 95 were for Dr. Murray and 41 for Dr. Seeger, and the Speaker declared Dr. Dwight H. Murray, Napa, Calif., elected Trustee to fill the unexpired term ending in 1947 of Dr. Edward M. Pallette, deceased.

On motion of Dr. Cary, seconded and carried, the election of Dr. Murray was made unanimous.

Nominations for Standing Committees

NOMINATIONS BY PRESIDENT ROGER I. LEE

Dr. Roger I. Lee, President, presented the following nominations:

1. Member of Judicial Council: Dr. Louis A. Buie, Rochester, Minn., to succeed Dr. George Edward Follansbee, deceased.

2. Member of Council on Scientific Assembly: Dr. Henry R. Viets, Boston, to succeed Dr. A. A. Walker, Birmingham, Ala.

The nomination of Dr. Buie was confirmed on motion of Dr. Walter E. Vest, West Virginia, duly seconded and carried.

On motion of Dr. A. A. Walker, Alabama, seconded and carried, the nomination of Dr. Viets was approved.

NOMINATIONS BY BOARD OF TRUSTEES

Dr. James R. Bloss, Chairman of the Board of Trustees, presented the following report:

Council on Medical Education and Hospitals: In accordance with the usual custom of submitting more than one name to the House of Delegates for each vacancy on the Council on Medical Education and Hospitals, the Board submits the following nominations for the vacancy created by the expiration of the term of Dr. Weiskotten:

Dr. H. G. Weiskotten, Syracuse, N. Y.

Dr. Wilburt C. Davison, Durham, N. C.

The Tellers spread the ballot, and the Secretary announced that 121 votes had been cast, of which Dr. Weiskotten received 75 and Dr. Davison 46.

The Speaker declared Dr. Herman G. Weiskotten, Syracuse, N. Y., elected to succeed himself as a member of the Council on Medical Education and Hospitals for a term ending in 1952.

Council on Medical Service and Public Relations: The Board wishes to submit the following nominations for the two vacancies on the Council on Medical Service and Public Relations:

For the vacancy caused by the expiration of the term of Dr. Adson: Dr. A. W. Adson, Rochester, Minn.; Dr. Edwin S. Hamilton, Kankakee, Ill., and Dr. Thomas F. Thornton, Waterloo, Iowa.

For the vacancy caused by the resignation of Dr. Leathers: Dr. William R. Brooksher, Fort Smith, Ark., who was elected by the Board to serve until this meeting of the House; Dr. Wingate Johnson, Winston-Salem, N. C., and Dr. Walter B. Martin, Norfolk, Va.

Dr. Bloss stated that he was authorized to present the resignation of Dr. John H. Fitzgibbon, Portland, Ore., who had been elected a Trustee. On motion, seconded and carried, the resignation was accepted.

Dr. Bloss then submitted the following nominations for a member of the Council on Medical Service and Public Relations to succeed Dr. Fitzgibbon: Dr. James P. Kerby, Salt Lake City; Dr. E. N. Roberts, Pocatello, Idaho, and Dr. Raymond L. Zech, Seattle.

Dr. E. S. Hamilton and Dr. Thomas F. Thornton withdrew their names, since they wished Dr. Adson to be retained as a member of the Council on Medical Service and Public Relations.

On motion, seconded and carried, Dr. A. W. Adson, Rochester, Minn., was elected for a term of three years to succeed himself, and the Speaker declared Dr. Adson so elected.

The Tellers spread the ballot for the election of a member of the Council on Medical Service and Public Relations to succeed Dr. W. S. Leathers, resigned. The Secretary announced that 103 votes had been cast, of which Dr. Brooksher received 46, Dr. Johnson 19 and Dr. Martin 38.

A second ballot was spread by the Tellers, with the omission of the name of Dr. Johnson, who had received the lowest number of votes cast, and the Secretary announced that 103 votes had been cast, of which Dr. Brooksher received 47 and Dr. Martin 56, and the Speaker declared Dr. Walter B. Martin, Norfolk, Va., elected a member of the Council on Medical Service and Public Relations for a term of three years to succeed Dr. Leathers.

The Tellers spread the ballot for the election of a member of the Council on Medical Service and Public Relations to succeed Dr. John H. Fitzgibbon, resigned.

The Secretary announced that 102 votes had been cast, of which Dr. Kerby received 23, Dr. Roberts 18 and Dr. Zech 61.

The Speaker declared Dr. Raymond L. Zech, Seattle, having received a majority of the votes cast, elected a member of the Council on Medical Service and Public Relations to succeed Dr. John H. Fitzgibbon, resigned, for a term ending in 1947.

Election of Affiliate and Associate Fellows

NOMINATIONS FOR AFFILIATE FELLOWSHIP APPROVED BY THE COUNCIL ON SCIENTIFIC ASSEMBLY

Dr. Olin West, Secretary, presented nominations for Affiliate Fellowship as follows, which were confirmed on motion of Dr. E. S. Hamilton, Illinois, seconded and carried:

Allen, William G., Evanston, Ill.	Kellogg, Ernest C. (nomination from California), Cove., Ore.
Armstrong, John H., Kirkwood, Mo.	Kleinman, Morris, New York.
Ayres, George T. (nomination from Minnesota), Phoenix, Ariz.	Koch, Otto W., St. Louis.
Bacon, L. C., Sr., St. Paul.	Leverich, Leslie (nomination from Kansas), Dallas, Texas.
Beatty, J. David, Los Angeles	Livermore, W. H., Chickasha, Okla.
Becker, W. H., St. Louis.	MacLennan, Angus D., Boston.
Bliss, Guy L., Long Beach, Calif.	McBratney, E. W., St. Louis.
Bogart, Arthur H., Brooklyn.	Otis, Newton M. (nomination from California), El Paso, Ill.
Bonner, Adolph, Brooklyn.	Parowski, S. W., Chicago.
Bullitt, James B., San Jose, Calif.	Peet, Edward W., New York.
Carpenter, H. L., Richmond, Calif.	Roberts, William H., LaJolla, Calif.
Carson, George R., San Francisco.	Ruddeyrow, Edward D., New York.
Clark, J. Bayard, New York.	Sewall, Edward C., Stanford University, Calif.
Denny, R. B., Creve Coeur, Mo.	Shaw, Perry H., Binghamton, N. Y.
Drummond, Winslow, Philadelphia.	Slemmons, J. Morris, Los Angeles.
Dudley, Carl E., St. Louis.	Trach, John M., Fairmont, W. Va.
Dunkley, J. H., Roanoke, Va.	Tupper, Virgil L., Bay City, Mich.
Fabricius, J. R. (nomination from New York), Pittsburgh	Vander Veer, E. A., Albany, N. Y.
Goddard, Walter W. (nomination from New York), Miami, Fla.	Vischer, L. G., Los Angeles.
Grad, Herman, Star Lake, N. Y.	Wiggers, A. F. A., Flushing, L. I.
Graham, H. B., San Francisco.	Wilcox, Homer B., Kingston, Pa.
Hoencs, A. J., Salt Lake City.	Williamson, N. E., Los Altos, Calif.
Holland, C. L., Fairmount, W. Va.	
Hooker, Ransom S. (nomination from New York), Charleston, S. C.	

NOMINATIONS FOR ASSOCIATE FELLOWSHIP

Dr. Olin West, Secretary, presented the following nominations for Associate Fellowship approved by the Judicial Council or by the executive committees of the Sections indicated, which were confirmed on motions, seconded and carried:

JUDICIAL COUNCIL

Kaufman, Lillie S., Dhamtari, Central Province, India.
Myer, Everett B., Castener, P. R.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

Stefan Ansbacher, Richmond Hill, N. Y.
Herbert Silvette, Charlottesville, Va.
van Dyke, Harry B., New York.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Seiberlich, Joseph, Durham, N. H.

Place of 1948 Annual Session

Dr. James R. Bloss, Chairman of the Board of Trustees, reported that an invitation to the Association, dated April 1945 to meet in St. Louis in 1948 has been received from the county and state medical societies as well as from the convention and publicity bureau. This is the only invitation received for 1948 as yet, at least it is the only one that has come to the attention of the Board.

Dr. Robert E. Schlueter, Missouri, extended an invitation from the Missouri State Medical Association and the St. Louis Medical Society and from the people of the city of St. Louis to convene in that city in the year 1948.

It was moved by Dr. George W. Kosmak, New York, seconded and carried, that the invitation to meet in St. Louis in 1948 be accepted with thanks.

Appointment of Members of Committee on Centennial Celebration

The Speaker announced the appointment of Members of the Committee on Centennial Celebration to Cooperate with the Board of Trustees, as follows: Dr. E. R. Cuniffe, New York, Chairman; Dr. Walter F. Donaldson, Pittsburgh; Dr. Thomas P. Murdoch, Meriden, Conn.; Dr. Thomas S. Cullen, Baltimore, and Dr. Warren F. Draper, of the U. S. Public Health Service.

Appointment of Members of Committee on Distinguished Service Award

The Speaker announced the appointment of the following members of the Committee on Distinguished Service Award to

succeed the two members whose terms expire at the present time: Dr. A. A. Walker, Birmingham, Ala., Chairman, and Dr. George H. Curfman, Denver.

Report of Reference Committee on Legislation and Public Relations

Dr. E. S. Hamilton, Chairman, presented the following report, which is presented as amended:

1. Resolution on Survey of Medical Societies in Metropolitan Centers re Qualifications of Their Physicians: Your reference committee is of the opinion that this is a purely local problem and should be handled by the local medical society.

2. Report of Committee on Rural Medical Service: The report of the Committee on Rural Medical Service, which was referred to your reference committee, was carefully reviewed. Your reference committee commends the Committee on Rural Medical Service for its work and recommends that members of that committee amplify and continue their work with the appointment of necessary state committees.

3. Supplementary Report of the Council on Medical Service and Public Relations Dealing with the Extension of the Emergency Maternal and Infant Care Program, Postwar: Your reference committee is strongly in favor of the passage of this resolution. It has already gone on record as being opposed to the Pepper bill, which is the basis of this report. It recommends the approval of this resolution.

4. Supplementary Report of Council on Medical Service and Public Relations Dealing with Resolutions on Modern Medical Public Relations: Your reference committee recommends the adoption of this report:

5. Supplementary Report of Council on Medical Service and Public Relations on Resolutions on Formation of a National Health Congress: Your reference committee recommends the adoption of these resolutions.

6. Supplementary Report of Council on Medical Service and Public Relations with Respect to Health Legislation Beneficial to the People: In view of the importance and magnitude of the report, your reference committee recommends that it be referred to the Board of Trustees and to the Council on Medical Service and Public Relations for study and report at the next meeting of the House of Delegates.

7. Supplementary Report of Board of Trustees Referring to Animal Experimentation: Your reference committee recommends the adoption of this report and further recommends that the Board of Trustees be instructed to prepare for widespread dissemination an illustrated booklet outlining the benefits to animals and mankind of animal experimentation. An effort should be made to cooperate with the national movement on this subject when it has introduced its plans in order to avoid duplication.

Respectfully submitted,

E. S. HAMILTON, Chairman.
JOHN J. MASTERSON.
EDWARD L. BORTZ.
RAYMOND L. ZECH.
LLOYD NOLAND.

On motion of Dr. Hamilton, duly seconded and carried, after discussion, the first six sections of the report of the reference committee were adopted.

The seventh section of the report as amended was adopted on motion of Dr. Hamilton, seconded and carried.

On motion of Dr. Hamilton, seconded by several and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. Carl R. Steinke, Chairman, presented the following report:

1. Report of Council on Medical Service and Public Relations Dealing with Membership and Fellowship: The Council recommends that the necessary changes in the By-Laws be prepared for submission to the House of Delegates to provide that any Fellow entering the armed forces retain his Fellowship and that all those who have been dropped as Fellows be reinstated and kept on the list of Fellows until the end of the war or six months after the termination of their military service. Such

Fellows, of course, would not be entitled to receive any of the journals unless they subscribed, but their status as Fellows would be protected.

The recommendation to remit Fellowship dues so that Fellowship would be protected in the medical forces was introduced in the House of Delegates at the 1943 session. At that time the matter was disapproved by the reference committee and its decision supported by the House of Delegates. The reason for this action was that the dues of Fellowship were so small that any one wishing to remain a Fellow could easily afford to pay that amount. As a great majority, if not all, of the component societies remit the dues of their members in service, practically all men remain members of the American Medical Association.

If any member loses his Fellowship because of failure to retain his affiliation with his county society, he cannot be carried as a Fellow. The first requirement in the qualifications necessary for Fellowship is that he be a member of the American Medical Association in good standing.

Fellows of the Association who stayed with the armed forces during World War II, whose Fellowship was permitted to lapse during their time of military service, may be restored to Fellowship on payment of Fellowship dues for the year during which their restoration to Fellowship is effected.

2. Supplementary Report of Council on Scientific Assembly Recommending Changes in Chapter XV of the By-Laws Dealing with the Scientific Sections: Your reference committee recommends approval of the following changes in the By-Laws:

Change the word "thirty-five" in the fourth line of section 10, chapter XV, to the word "sixty," so that the first four lines of section 10, chapter XV, will read:

"Sec. 10. TIME AT WHICH TITLES MUST BE IN.—Titles of papers to be presented to the section must be in the hands of the secretary of the section at least sixty days before the first day of the"

Change section 15 of chapter XV of the By-Laws to be section 16 and insert as new section 15 the following:

"Sec. 15. PRESENTATION OF RESOLUTIONS.—No resolution shall be presented before any section later than the regular Executive Session on the second day of the section meeting at which time the officers are elected.

Respectfully submitted,

CARL R. STEINKE, Chairman.
K. S. J. HOHLEN.
GEORGE P. JOHNSTON.
ROSS S. McELWEE.
THOMAS A. FOSTER.

3. Resolution Suggesting Amendment to By-Laws, Chapter XII, Section 2: Your reference committee is informed that this must lie over until next year, since it was not introduced until today.

On motion of Dr. Steinke, seconded and carried, the first two sections of the report of the reference committee were adopted, and on motion, seconded and carried, the By-Laws were amended as suggested in the second section of the report of the reference committee just approved.

The Speaker announced that the amendment referred to in the third section of the report of the reference committee could not be acted on this year.

On motion of Dr. Steinke, seconded and carried, the report of the reference committee was adopted as a whole.

Unfinished Business

Annual Session in San Francisco in 1946: Dr. John W. Cline, California, extended a cordial invitation to attend the San Francisco session in 1946.

Proposed Amendment to Constitution: Dr. Henry A. Luce, Michigan, with unanimous consent of the House, presented the following amendment to the Constitution, which must lie over for action until next year: Amend section 3, article 5, of the Constitution by substituting the figure "176" for the figure "175" in the second line of this section, so that the first sentence of section 3, article 5, will read: "The total voting membership of the House of Delegates shall not exceed 176."

On motion, seconded and carried, the House adjourned at 5:30 p. m. to meet in San Francisco July 1, 1946.

Washington Letter

(From a Special Correspondent)

Dec. 17, 1945.

Construction of Twenty-Nine Additional Veterans' Hospitals Approved

Construction of twenty-nine new Veterans Administration hospitals and one veterans' home and transfer to the agency of seven surplus army hospitals has been authorized by President Truman. Five of the army hospitals will be for temporary use. The program announced by the President will give the agency 13,422 more beds, in addition to the 15,726 beds authorized under construction sanctioned last October. Coincidentally General Omar Bradley, veterans administrator, announced that Winter General Hospital at Topeka, Kan., acquired by the Army, will become a center for neuropsychiatric training under Dr. Karl A. Menninger, psychiatrist and brother of Brig. Gen. William C. Menninger, chief of the Army psychiatric division. The new veterans' hospitals will be built near major medical centers: Columbia University College of Physicians and Surgeons, University of Alabama School of Medicine, University of Arkansas School of Medicine, University of Michigan Medical School, Washington University School of Medicine outside St. Louis, Cornell University Medical College, Syracuse University College of Medicine, Duke University School of Medicine, University of Pennsylvania School of Medicine, Temple University School of Medicine, Jefferson Medical College of Philadelphia and the medical center at Charlotte, N. C. Major Gen. Paul Hawley, medical director, states that the agency will lean heavily on established medical schools and the urban medical centers of the nation.

87,001 Illegitimate Births Reported in Nation

Census Bureau reports that there were 87,001 illegitimate births in 1944, a gain of 4,415 over 1943, in thirty-eight states and the District of Columbia. When allowance is made for those not reported, it was estimated that there would be 100,000 illegitimate births. The 87,001 does not record illegitimate births in California, Colorado, Connecticut, Maryland, Massachusetts, Nebraska, New Hampshire, New Mexico, New York and Wyoming, which do not require statements on legitimacy for birth registration. Of the total recorded, 36,252 were white and 50,749 nonwhite.

Wide Acclaim for Voluntary Prepaid Medical Plan

The American Medical Association plan to establish a national system of voluntary prepaid medical care was widely publicized by the Washington press and evoked favorable comment. Coincident with the announcement from the House of Delegates of the Association, sponsors of the Truman health plan bought advertising space in daily papers to advocate its passage and to reiterate Mr. Truman's claim that it was not socialized medicine.

House Approves Another Billion and Half for UNRRA

The House has approved a bill authorizing a second government contribution to the United Nations Relief and Rehabilitation Administration of \$1,350,000,000. The bill has been sent to the Senate. It carries a rider calling on President Truman to try "through appropriate channels to facilitate" the entry of American newspapermen into countries receiving UNRRA assistance.

Capital Notes

Finest recognition of psychologists is that military establishments are setting up permanent sections, John G. Jenkins, Navy Aviation Psychology Chief, told the American Psychological Association. Millard W. Rice, national service director, disabled American veterans, told the National Council of the Physically Handicapped, "The handicapped will be the first fired and the last hired."

During hearings on the proposal to license practical nurses in the District of Columbia it was suggested that the District Nurses Examining Board be stripped of control over the nursing profession.

Childrens Hospital doctors have started a "research foundation" to compile all discoveries made in the hospital wards, marking the hospital's seventy-fifth anniversary.

Lieut. Col. S. Ross Taggart, soon to be discharged from the Army Medical Corps, has been named director of the District of Columbia Bureau of Venereal Diseases.

Medical Legislation

MEDICAL BILLS IN CONGRESS

Veterans Administration

The bill to establish a Department of Medicine and Surgery in the Veterans' Administration, H. R. 4717, has passed the House of Representatives. As passed, the bill contains the provision under which the utilization of osteopathic services in veterans' hospitals will be authorized. In the Senate, the bill has been referred to the Senate Committee on Finance.

The construction of veterans' hospitals in or near the city of Ukiah, Mendocino County, Calif., and at Paradise, Butte County, Calif., will be authorized respectively by H. R. 4738 and H. R. 4741, both introduced by Representative Lea, California.

A bill introduced by Representative Peterson, Florida, H. R. 4847, proposes domiciliary and hospital care for veterans with non-service connected injuries or diseases who have reached the age of 65 years.

Senator Langer, North Dakota, proposes by S. 1633 that the Secretary of War be directed to provide facilities and personnel for the hospitalization and treatment of members of the armed forces suffering from transverse myelitis or related disabilities "at one hospital located in an area in which climatic conditions are favorable for treatment of such cases, and to transfer to such hospital all such persons undergoing or in need of hospitalization and treatment."

A Senate bill, S. 1626, introduced by Senator McFarland, Arizona, proposes that, in the administration of laws providing for the hospitalization and treatment of former members of the armed forces and laws providing for the payment of pensions to former members of the armed forces or their dependents, any person who is disabled as a result of injuries incurred, or disease contracted, subsequent to Sept. 15, 1940 in the performance of his duties as a member of the American field service shall be deemed to have incurred such injuries or contracted such disease in line of duty while serving on active duty in the armed forces.

Representative Hedrick, West Virginia, by H. R. 4679, proposes to provide compensation for veterans of World War II who have had tuberculosis.

Barbiturates

By H. Res. 440, submitted by Representative Rogers, Massachusetts, the Secretary of the Treasury will be requested to furnish the House of Representatives (1) such facts as may be in his possession regarding the use by the public of barbiturates and (2) the facts with respect to the best method or methods of protecting the consuming public from the improper use of barbiturates resulting from the indiscriminate distribution and sale of such drugs.

Navy Medical Corps

S. Res. 200, submitted by Senator Reed, Kansas, would request the Secretary of the Navy to appoint a board of inquiry to ascertain why the demobilization of medical and dental officers has not been expedited.

The Hill-Burton Hospital Construction Bill

S. 191, the Hill-Burton hospital construction bill, has passed the Senate in substantially the same form in which it was reported by the Senate Committee on Education and Labor.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Surgical Meeting.—Honorary membership in the Los Angeles Surgical Society was presented to Dr. Frederick A. Collier, professor and head of the department of surgery, University of Michigan Medical School, Ann Arbor, during the annual meeting of the society, December 13, at the California Club, Los Angeles. Dr. Collier addressed the meeting on "Replacement Therapy Following Operation and Other Types of Trauma." The retiring secretary-treasurer, Dr. Conrad J. Baumgartner, Los Angeles, will assume the presidency in 1946, and Dr. Kenneth E. Smiley, Los Angeles, will become secretary-treasurer.

Violation of Health and Safety Code.—Four persons in Long Beach who violated the health and safety code have been indicted by the grand jury for criminal conspiracy on evidence collected by four state agencies, the bureau of food and drug inspections of the California state department of public health, the department of justice, the state board of pharmacy and the state board of medical examiners. One of the persons, a chiropractor, is the owner of what was known as the Metropolitan Health Institute. Three other persons who were called doctors but were not licensed gave "health" lectures at the institute, which was located on the Pike in Long Beach. Essentially, according to *California's Health*, the institute was a medicine show. Drugs, principally laxatives, were sold under fancy names for fancy prices. It was claimed that these drugs would cure such disorders as arteriosclerosis, Bright's disease, cholecystitis, gallstones, heart and vascular diseases, high blood pressure, dental caries, nephritis, prostate gland disorders, pyelitis, sexual impotence, sinus infection, uremia, ulcers of the stomach and varicose ulcers. The purchaser of the nostrum would be given a certificate at the time of the purchase entitling the purchaser to a free consultation at the clinic. The chiropractor, who owned the business, made the examinations and diagnosis at the clinic. He prescribed the same drugs for the same disorders as had previously been recommended by the spiliers. It is estimated that 80 to 90 per cent of the patients were over 60 years of age. The individuals, who were not named in *California's Health*, November 15, are charged with falsely advertising various drugs, representing certain drugs as having an effect on certain diseases, with operating a clinic without a license, practicing medicine without a license and for violation of the Chiropractic Act in the prescribing of drugs.

COLORADO

Harvey Sethman Returns to State Society.—Major Harvey T. Sethman has been relieved of active duty with the Medical Administrative Corps of the Army and has returned to his positions as executive secretary of the Colorado State Medical Society and managing editor of the *Rocky Mountain Medical Journal*. Mr. Sethman has resumed his positions with the society as of December 1. The board of trustees of the society request that addresses for official correspondence and exchange journals be appropriately changed, noting that the office and mailing address of the society and the *Journal* remain at 537 Republic Building, Denver 2, as in the past.

FLORIDA

Survey of Anemia.—The Alachua County Medical Society has endorsed a program now under way to test all school children in the county to determine the cause of borderline anemia. The work is being directed by Dr. Walter E. Wilkins, Raleigh, N. C., U. S. Public Health Service.

Personal.—Dr. Annette M. B. Feaster, St. Petersburg, president of the Pinellas County Medical Society, is the first woman to hold this office. Dr. Feaster has also served as secretary of the society.—Dr. Leland H. Dame, Sebring, has been appointed health director of Orange County to succeed Dr. William P. Rice, resigned.—Dr. Charles G. Hedges, Vallejo, Calif., has been appointed superintendent of the Jackson Memorial Hospital, Miami.

ILLINOIS

Scientist Honored For Work on Betatron.—Donald W. Kerst, Ph.D., Urbana, on November 16 was presented with the \$3,000 Cyrus B. Comstock Prize of the National Academy of Sciences in recognition of his invention of the betatron. The award is given every five years for "the most important discovery or investigation in electricity or magnetism or radiant energy." Kerst was selected for the honor in 1943, but the presentation was forbidden by wartime secrecy.

Chicago

Personal.—Leslie D. Reid, assistant superintendent of the Presbyterian Hospital since July 1944, has been named superintendent to succeed Herman Hensel, who resigned because of ill health.

Memorial Services for Peter Bassoe.—Memorial services for Dr. Peter Bassoe, who died November 5, were held in the Presbyterian Hospital December 16 with Dr. James B. Herrick presiding. Dr. Bassoe's life was discussed by Dr. Ludwig Hektoen and his work in the Presbyterian Hospital, Rush Medical College and the University of Illinois by Dr. Ernest E. Irons, in the Chicago Neurological Society, Institute of Medicine of Chicago and American Neurological Association by Dr. Lewis J. Pollock and in the Illinois Psychiatric Society, Chicago Pathological Society and Central Neuropsychiatric Association by Dr. Percival Bailey.

Addition for Experimental Animals.—The fifteenth floor of the Ward Memorial Building, Northwestern University Medical School, is now under construction for the housing of experimental animals. The equipment will be the most modern type, with air conditioned and temperature controlled rooms, stainless steel cages and tile walls and floors. One wing will have animal quarters to be used principally for receiving and housing dogs; the other wing is to have rooms which will be occupied by the Institute of Neurology and other departments that use animals for experimental purposes. The wing on the fourteenth floor, vacated through the addition of the new floor, will be used by the department of experimental medicine.

James Leary Resigns from Daily News.—James C. Leary, science editor of the Chicago *Daily News*, has resigned to become research associate with Lawrence C. Salter & Associates, Consultants for Science, Chicago and New York. Mr. Leary will make his headquarters at the home office of the organization in Chicago. As research associate, Mr. Leary will work on several of the scientific research projects being carried out for various clients of the Salter consultants. Mr. Leary had served on the staff of the Newark, N. J., *Evening News*, Newark *Star-Eagle* and the Chicago bureau of the Associated Press before joining the Chicago *Daily News* in 1935. He is president-elect of the National Association of Science Writers, a member of the committee on information of the Division of Medical Sciences of the National Research Council, a consultant to the Surgeon General of the Army, Major Gen. Norman T. Kirk, and a member of Sigma Delta Chi, the national professional journalistic fraternity, and of the National Press Club, Washington, D. C.

KANSAS

Changes in Health Personnel.—Dr. Harvey L. Bogan, Baxter Springs, has been appointed temporary part time officer of Cherokee County and Dr. Louise V. F. Richmond, Hutchinson, has been named a part time health officer of Reno County. Dr. James E. Wolfe, who for many years has served as part time health officer of the city of Wichita, is now director of the Wichita Health Department, which since July 1 has been operating on a full time basis. Dr. John W. Turner, Wichita, health officer of Sedgwick County, has been granted a year's leave of absence to study at the University of Michigan School of Public Health, Ann Arbor; Dr. Horace Dale Palmer Jr. will serve as assistant health officer during Dr. Turner's absence. Dr. Joseph W. Spearing, Columbus, has been named a member of the state board of health to fill the vacancy caused by the death of Dr. Harry L. Aldrich, Caney.

MAINE

Outbreak of "Mysterious Disease."—Newspapers report the recent closing of the public schools in Waterville because of a "mysterious disease" which caused the death of 4 children and forced nearly 500 of the 2,700 pupils in the city schools to be absent from classes. According to the reports, November 15, Dr. Arthur R. Daviau, city health officer, attributed the outbreak to "diphtheria and something else" which had not been identified. The order not only closed the schools, but banned the pupils from theaters and other public places.

MASSACHUSETTS

State Society Sets Up Postwar Loan Fund.—A Postwar Loan Fund has been set up and all discharged medical officers who were members of the Massachusetts Medical Society in good standing at the time of their entry into the service may apply for loans from this fund. For further information apply to Dr. George L. Schadt, Chairman, Postwar Loan Fund, 8 Fenway, Boston 15.

Eugene Eppinger Appointed Assistant Dean.—Col. Eugene C. Eppinger, formerly physician to students, Harvard Medical School, Boston, has been appointed assistant dean in charge of courses for graduates. He succeeds Dr. Frank R. Ober, who has been doing this work since 1928. The new appointment will be effective January 1. Dr. Eppinger will take over the direction of all courses for graduates, including the refresher courses for returning veterans. The initial plans for these courses have been drawn up by Dr. Chester M. Jones, Boston, and a committee. On the assumption of his new duties, Dr. Eppinger will implement the work of that committee as well as supervise the other courses of instruction for physicians.

Loren Moore in Charge of New Blood Program.—Col. Loren D. Moore, M. C., U. S. Army, retired, who recently became assistant director of the division of biologic laboratories of the Massachusetts Department of Health, will be in direct charge of the new civilian blood service program which has been inaugurated by the state department (*THE JOURNAL*, November 24, p. 894). Voluntary blood donations will be collected throughout the state by a mobile team, with the assistance of local chapters of the American Red Cross and other community agencies. The team will operate first in those areas which are not at present served by community blood and plasma banks. Collection of blood donations are to begin this month.

MICHIGAN

New Cancer Clinic.—The Women's Cancer Detection Clinic, Inc., was opened in the Hancock School, Detroit, on November 19. The clinic is sponsored by the Detroit Federation of Women's Clubs and is patterned after a number of such clinics functioning throughout the country. No treatments will be given, but, if symptoms calling for medical attention are found, the patient will be referred to her family physician. Dr. Mary Margaret Frazer, Detroit, is medical director. The clinic has been provided by the Detroit Board of Education and the Wayne County Medical Society. It will be maintained by contributions from interested examinees, citizens and organizations who wish to further its work.

Course in Occupational Health and Medicine.—Wayne University School of Occupational Health announces a twelve week orientation course in the field of occupational health and medicine beginning January 7. The course will consist of a presentation of fundamental principles and practices involved in establishing, organizing and operating employee health programs, the administration of employee health programs and the interrelations of medical, engineering (hygiene, sanitation and safety) and personnel activities in industrial organizations. Among those presenting the course will be Dr. Rutherford T. Johnstone, Los Angeles; Dr. Leroy U. Gardner, Saranac Lake, N. Y.; Dr. Oscar A. Sander, Milwaukee; Dr. Louis Schwartz, Washington, D. C.; Dr. Robert A. Kehoe, Cincinnati; Dr. Clarence D. Shelby, Detroit; Dr. Earle A. Irvin, Detroit; William P. Yant, Sc.D., Pittsburgh; J. M. Dallavalle, D.Sc., New York; Don D. Irish, Ph.D., Midland, Mich.; Dr. Grover C. Penberthy, Detroit; Dr. Alfred H. Whittaker, Detroit; Dr. Thomas Dublin, New York; Anna M. Bactjer, Sc.D., Baltimore; Dr. William J. McConnell, New York; Dr. Gordon A. Eadie, Detroit; Dr. Leo H. Bartemeier, Detroit; Dr. Parker Heath, Detroit, and Dr. John M. Murray, Boston. The course will be of special interest to physicians returning from military service.

Woman Anatomist Named Russel Lecturer.—Elizabeth C. Crosby, Ph.D., professor of anatomy, University of Michigan Medical School, Ann Arbor, has been appointed by the board of regents as the Henry Russel Lecturer for 1945-1946. Dr. Crosby is the first woman to be thus honored at the University of Michigan since the annual appointments were begun in the fall of 1925. The honor goes each year to the faculty member adjudged to have made the most significant contribution to the advancement of the field in which he is specializing. Besides the honor of giving the Henry Russel Lecture next May, the selection also includes a stipend paid from the endowment established by Henry Russel, LL.B., of Detroit. Dr. Crosby has been a member of the University of Michigan faculty since 1920. She teaches neuroanatomy to freshmen and graduate students. In her research work she has specialized

in the study of the nervous system, the nuclear masses in the brain and the fiber connections of the cell groups. In this connection Dr. Crosby has conducted extensive research in the phylogenetic development of the brain in all of the vertebrates, including man. Dr. Crosby received her Ph.D. at the University of Chicago in 1915.

MISSISSIPPI

Personal.—Dr. Lillian L. Nye, formerly of St. Paul, has been appointed head of the health service of the Mississippi State College for Women at Columbus. Mrs. Elizabeth Nisbet Wates, Jackson, was recently named state commander of the American Cancer Society, which is opening offices in the Lorenza Building, Jackson. Dr. Emma V. Gay, Biloxi, formerly state commander, has been placed in charge of the regional education program of the American Cancer Society and will also serve as district commander and member of the state executive committee.

Children's Code Commission Formed.—The Mississippi Children's Code Commission was appointed by Governor Thomas L. Bailey on September 24. The commission consists of eighty members representing medical, legal, teaching, civic and service organizations. Physician members include:

Dr. Taswell P. Haney Jr., Laurel, director, Jones County Health Department.

Dr. Charles B. Mitchell, Whitfield, superintendent, Mississippi State Hospital.

Dr. Felix J. Underwood, Jackson, executive officer, Mississippi State Board of Health.

Dr. Estelle A. Magiera, Jackson, director, Child Guidance Center, State Board of Health.

Dr. Virginia F. S. Howard, Jackson, director, Maternal and Child Division, Mississippi State Board of Health.

Dr. Henry C. Ricks, Jackson, director, State Hygienic Laboratory, State Board of Health.

Governor Bailey asked the commission to assume the following responsibilities: study the conditions in the state affecting the welfare of children, and the present laws pertaining thereto; review the functions and facilities of the various agencies and institutions in the state charged with the care, control and protection of children; recommend definite legislation planned as part of a consistent unified whole, for the establishment of minimum standards for adequate care and protection of children in the areas of their needs and furnish informational and educational services throughout the state from the results of the studies and research of the commission. The commission has been divided into four subcommittees on the normal child, the handicapped child, the delinquent child and the dependent child. Among legislation which the commission is being asked to recommend is the premarital blood test, the compulsory school attendance law and a new juvenile court system. The division of maternal and child health is at the present time completing a survey among pediatricians in the state on the pressing needs of children in Mississippi. This information will be considered by the commission.

MISSOURI

Barnard Lecture.—Dr. Cornelius P. Rhoads, New York, gave the seventh annual Barnard Hospital Lecture in the auditorium of the St. Louis Medical Society, November 20. His subject was "Nutritional Aspects of the Cancer Problem."

Pilgrimage to Beaumont Grave.—The St. Louis Medical Society on Thanksgiving Day, November 22, resumed its annual pilgrimage to William Beaumont's grave in Bellefontaine cemetery. Philip A. Shaffer, Ph.D., dean of Washington University School of Medicine, St. Louis, gave the address.

NEW YORK

New Clinic for Children with Cerebral Palsy.—A newly created clinic for children suffering from cerebral palsy has been established at Strong Memorial Hospital in cooperation with the orthopedic and pediatric departments of the hospital and the University of Rochester School of Medicine and Dentistry cooperating. Ten hospital beds will be set up. Physical examinations in the clinic will be coupled with psychiatric tests, and home treatment will be outlined for ambulatory patients. Those needing hospital treatment will be brought into the new hospital division and when able will be moved to the Convalescent Hospital for Children on Beach Avenue. Arrangements have been completed for financial aid to parents unable to meet the cost of hospitalization or treatment.

John Bourke to Direct State Hospital Service.—Dr. John J. Bourke, Albany, on terminal leave as chief medical officer on a Coast Guard assault vessel and formerly deputy director of the State Legislative Health Preparedness Commission, has been appointed director of the statewide survey

of hospital facilities, which was to start about November 15 for the state joint hospital board. Robert T. Landsdale, commissioner of the state department of social welfare, is chairman of the joint hospital board which was recently appointed by Governor Thomas E. Dewey to prepare a state hospital inventory and survey of needed hospital construction. Other members include Dr. Edward S. Godfrey Jr., Albany, commissioner of the state department of health; Dr. Frederick MacCurdy, commissioner of the state department of mental hygiene, as vice chairman, and Assemblyman Lee Mailler as adviser. The joint hospital board is acting for and with the planning commission in making the survey. Governor Dewey, in designating the planning commission as the single agency responsible for the inventory, and in creating the Joint Hospital Board to act with the commission, was acting in accordance with the provisions of the federal hospital construction bill, known as the Hill-Burton bill, just reported to the U. S. Senate from the Committee on Education and Labor. Dr. Bourke's headquarters will be in the offices of the State Post-war Public Works Planning Commission, State Office Building, Albany.

New York City

Conference on Fertility.—The annual conference on fertility of the National Committee on Maternal Health will be held at the Hotel Commodore, February 1-2. Two major topics will be considered, one on the Detection and Induction of Ovulation and the other on Sperm Biology, with particular reference to sperm migration in relation to the female genital tract. The speakers will include investigators from the fields of animal husbandry and from clinical and laboratory studies related to man.

William Schmidt Associated With Joint Distribution Committee.—Dr. William M. Schmidt, formerly medical director for the New York region of the Children's Bureau, U. S. Department of Labor, Washington, D. C., is en route to Europe to supervise the health and medical services on the continent of the Joint Distribution Committee, it was announced December 3. The health activities of the Joint Distribution Committee are an integral part of the extensive relief and rehabilitation program carried out by eighty field workers of the committee in every country of Europe.

Progress of Eye Bank.—About sixty hospitals in nine states are currently cooperating with the Eye Bank for Sight Restoration, 210 East 64th Street, New York. In Greater New York alone, thirty-two hospitals are associated in the movement to make available for distributing healthy corneal tissue for those whose sight may be restored through corneal graft operations by which ocular opacity is overcome, the announcement stated. In addition, eight hospitals in other New York State cities, together with six in New Jersey, three in Connecticut and one each in six other states, have become actively affiliated with the movement. Organized only last February, the eye bank was established for the collection, preservation and distribution of healthy corneas, which may be obtained only from persons either living or immediately after death. As corneas may be preserved and utilized for transplanting to the eyes of others for only seventy-two hours, speedy collection and distribution are essential as soon as they are obtained. Whenever cooperating hospitals have eyes available, the Red Cross Motor Corps rushes them to the Eye Bank for distribution to persons requiring the corneal graft operation.

NORTH CAROLINA

Personal.—Dr. Robert T. Stimpson, Raleigh, director of the Bureau of Vital Statistics of the state board of health since 1934, resigned October 1 to go into general practice in Winston-Salem.—Dr. George F. Baier Jr. has resigned as coroner of Buncombe County.

Psychologist Named in New Program.—Donald S. Carter, New York, has been named clinical psychologist for the state mental hospitals in North Carolina, newspapers report. The appointment marks the first time a full time clinical psychologist has been named in the state's mental program. The appointment was announced to the press by Dr. David A. Young, general superintendent of mental health for the state hospitals of North Carolina, also a newly created position (THE JOURNAL, July 14, p. 819). Mr. Carter will have a permanent office in the state hospital in Raleigh.

Physician Named to Direct Surplus Properties Program.—Dr. Sylvester D. Craig, Winston-Salem, president of the North Carolina State Board of Health, has been named to direct the surplus properties program of the North Carolina State Board of Health. Dr. Craig will act as liaison officer

in the handling of matters affecting surplus government property that can be used by hospitals and public health agencies in North Carolina. He will advise with hospitals and health agencies on what suitable surplus property is available, complete their needs and requests, and transmit the information to the proper authorities in Washington.

OHIO

John Caughey Appointed Assistant Dean.—Dr. John L. Caughey Jr., New York, who has for four years been studying the human constitution in relation to disease at Presbyterian Hospital, New York, has been named assistant dean at Western Reserve University School of Medicine, Cleveland, a newly created position. Dr. Caughey will supervise admissions and keep in touch with the progress of the students. He will also continue his research.

Prentiss Award Goes to Charles Winslow.—The Elisabeth S. Prentiss National Award in health education for 1945 was presented to Charles-Edward A. Winslow, Dr. P.H., New Haven, Conn., during a special program at the Cleveland Health Museum, November 27. The principal address was given by Dr. Winslow on "Ten Unattained Goals of Public Health." Dr. Robert L. Dickinson, New York, who was guest of honor, spoke on "Sex Education—Sex Evolution." The program also included James R. Angell, New Haven, Conn., president emeritus, Yale University School of Medicine, and Dr. William W. Peter, Washington. This was the second award of the Prentiss Prize (THE JOURNAL, Jan. 15, 1944, p. 181; Nov. 18, 1944, p. 781).

Advisory Committee on Child Hygiene.—Dr. Roger E. Heering, state health commissioner, has appointed an advisory committee to the division of child hygiene of the Ohio State Department of Health, following consultation with the council of the state medical association. Members of the committee include Dr. James G. Kramer, Akron; Dr. Robert A. Lyon, Cincinnati; Dr. Loyal E. Leavenworth, Canton; Dr. Dana W. Cox, Columbus; Dr. John A. McNamara, Marion, and Dr. Herbert D. Chamberlain, McArthur. The committee will act in an advisory capacity to the division, of which Dr. Susan P. Souther, Columbus, is director, on matters of policy and procedure in the operation of the department's maternal and child hygiene programs.

WASHINGTON

John Fouts Named Health Officer of King County.—Dr. John D. Fouts, London, Ky., has been appointed health officer of King County, filling the vacancy that occurred when Dr. Emil E. Palmquist accepted an appointment as city health commissioner of Seattle (THE JOURNAL, July 28, p. 964).

New Editors.—Dr. Robert N. Rutherford, Seattle, is the new editor of the *Western Journal of Surgery, Obstetrics and Gynecology*, succeeding Dr. Goodrich C. Schaeffer, Portland, Ore.—Dr. Joseph M. Aspray, Spokane, has been appointed editor of the Bulletin of the Spokane County Medical Society.

State Medical Board.—Gov. Mon C. Wallgren recently appointed Drs. Alexander Grinstein, Seattle, Thomas Ingham, Olympia, and John C. Lindsay, Ritzville, as members of the Washington State Board of Medical Examiners. Retiring members are Drs. Philip C. Kyle, Tacoma; David Metheny, Seattle, and Robert L. Rotchford, Spokane.

Blood Bank Building.—Ground was broken by Mayor William F. Devin of Seattle for the new home of the King County Central Blood Bank. The building is to be constructed on the southwest corner of Terry Avenue and Madison Street on property donated by Dr. Simon Maimon Samuels, Seattle (THE JOURNAL, June 23, p. 606). The blood bank recently completed its first anniversary.

WEST VIRGINIA

Financial Responsibility of Cancer Care.—The West Virginia State Department of Public Assistance will be responsible for payment for care of any case of cancer referred by it to any hospital or placed under the care of a doctor up to the point at which responsibility for such care and treatment is assumed by the division of cancer control of the state health department. When information is received from the division of cancer control that a case is incurable, the department of public assistance will assume the cost of necessary palliative treatment or other necessary care if the patient meets the eligibility requirements of the department. In all cases the assumption of responsibility for care of incurable cases by the department will depend on the economic eligibility of the indi-

MASSACHUSETTS

State Society Sets Up Postwar Loan Fund.—A Postwar Loan Fund has been set up and all discharged medical officers who were members of the Massachusetts Medical Society in good standing at the time of their entry into the service may apply for loans from this fund. For further information apply to Dr. George L. Schadt, Chairman, Postwar Loan Fund, 8 Fenway, Boston 15.

Eugene Eppinger Appointed Assistant Dean.—Col. Eugene C. Eppinger, formerly physician to students, Harvard Medical School, Boston, has been appointed assistant dean in charge of courses for graduates. He succeeds Dr. Frank R. Ober, who has been doing this work since 1928. The new appointment will be effective January 1. Dr. Eppinger will take over the direction of all courses for graduates, including the refresher courses for returning veterans. The initial plans for these courses have been drawn up by Dr. Chester M. Jones, Boston, and a committee. On the assumption of his new duties, Dr. Eppinger will implement the work of that committee as well as supervise the other courses of instruction for physicians.

Loren Moore in Charge of New Blood Program.—Col. Loren D. Moore, M. C., U. S. Army, retired, who recently became assistant director of the division of biologic laboratories of the Massachusetts Department of Health, will be in direct charge of the new civilian blood service program which has been inaugurated by the state department (THE JOURNAL, November 24, p. 894). Voluntary blood donations will be collected throughout the state by a mobile team, with the assistance of local chapters of the American Red Cross and other community agencies. The team will operate first in those areas which are not at present served by community blood and plasma banks. Collection of blood donations are to begin this month.

MICHIGAN

New Cancer Clinic.—The Women's Cancer Detection Clinic, Inc., was opened in the Hancock School, Detroit, on November 19. The clinic is sponsored by the Detroit Federation of Women's Clubs and is patterned after a number of such clinics functioning throughout the country. No treatments will be given, but, if symptoms calling for medical attention are found, the patient will be referred to her family physician. Dr. Mary Margaret Frazer, Detroit, is medical director. The clinic has been provided by the Detroit Board of Education and the Wayne County Medical Society. It will be maintained by contributions from interested examinees, citizens and organizations who wish to further its work.

Course in Occupational Health and Medicine.—Wayne University School of Occupational Health announces a twelve week orientation course in the field of occupational health and medicine beginning January 7. The course will consist of a presentation of fundamental principles and practices involved in establishing, organizing and operating employee health programs, the administration of employee health programs and the interrelations of medical, engineering (hygiene, sanitation and safety) and personnel activities in industrial organizations. Among those presenting the course will be Dr. Rutherford T. Johnstone, Los Angeles; Dr. Leroy U. Gardner, Saranac Lake, N. Y.; Dr. Oscar A. Sander, Milwaukee; Dr. Louis Schwartz, Washington, D. C.; Dr. Robert A. Kehoe, Cincinnati; Dr. Clarence D. Shelby, Detroit; Dr. Earle A. Irvin, Detroit; William P. Yant, Sc.D., Pittsburgh; J. M. Dallavalle, D.Sc., New York; Don D. Irish, Ph.D., Midland, Mich.; Dr. Grover C. Penberthy, Detroit; Dr. Alfred H. Whittaker, Detroit; Dr. Thomas Dublin, New York; Anna M. Baetjer, Sc.D., Baltimore; Dr. William J. McConnell, New York; Dr. Gordon A. Eadie, Detroit; Dr. Leo H. Bartemeier, Detroit; Dr. Parker Heath, Detroit, and Dr. John M. Murray, Boston. The course will be of special interest to physicians returning from military service.

Woman Anatomist Named Russel Lecturer.—Elizabeth C. Crosby, Ph.D., professor of anatomy, University of Michigan Medical School, Ann Arbor, has been appointed by the board of regents as the Henry Russel Lecturer for 1945-1946. Dr. Crosby is the first woman to be thus honored at the University of Michigan since the annual appointments were begun in the fall of 1925. The honor goes each year to the faculty member adjudged to have made the most significant contribution to the advancement of the field in which he is specializing. Besides the honor of giving the Henry Russel Lecture next May, the selection also includes a stipend paid from the endowment established by Henry Russel, LL.B., of Detroit. Dr. Crosby has been a member of the University of Michigan faculty since 1920. She teaches neuroanatomy to freshmen and graduate students. In her research work she has specialized

in the study of the nervous system, the nuclear masses in the brain and the fiber connections of the cell groups. In this connection Dr. Crosby has conducted extensive research in the phylogenetic development of the brain in all of the vertebrates, including man. Dr. Crosby received her Ph.D. at the University of Chicago in 1915.

MISSISSIPPI

Personal.—Dr. Lillian L. Nye, formerly of St. Paul, has been appointed head of the health service of the Mississippi State College for Women at Columbus.—Mrs. Elizabeth Nisbet Wates, Jackson, was recently named state commander of the American Cancer Society, which is opening offices in the Lorenza Building, Jackson. Dr. Emma V. Gay, Biloxi, formerly state commander, has been placed in charge of the regional education program of the American Cancer Society and will also serve as district commander and member of the state executive committee.

Children's Code Commission Formed.—The Mississippi Children's Code Commission was appointed by Governor Thomas L. Bailey on September 24. The commission consists of eighty members representing medical, legal, teaching, civic and service organizations. Physician members include:

Dr. Taswell P. Haney Jr., Laurel, director, Jones County Health Department.

Dr. Charles B. Mitchell, Whitfield, superintendent, Mississippi State Hospital.

Dr. Felix J. Underwood, Jackson, executive officer, Mississippi State Board of Health.

Dr. Estelle A. Magiera, Jackson, director, Child Guidance Center, State Board of Health.

Dr. Virginia F. S. Howard, Jackson, director, Maternal and Child Division, Mississippi State Board of Health.

Dr. Henry C. Ricks, Jackson, director, State Hygienic Laboratory, State Board of Health.

Governor Bailey asked the commission to assume the following responsibilities: study the conditions in the state affecting the welfare of children, and the present laws pertaining thereto; review the functions and facilities of the various agencies and institutions in the state charged with the care, control and protection of children; recommend definite legislation planned as part of a consistent unified whole, for the establishment of minimum standards for adequate care and protection of children in the areas of their needs and furnish informational and educational services throughout the state from the results of the studies and research of the commission. The commission has been divided into four subcommittees on the normal child, the handicapped child, the delinquent child and the dependent child. Among legislation which the commission is being asked to recommend is the premarital blood test, the compulsory school attendance law and a new juvenile court system. The division of maternal and child health is at the present time completing a survey among pediatricians in the state on the pressing needs of children in Mississippi. This information will be considered by the commission.

MISSOURI

Barnard Lecture.—Dr. Cornelius P. Rhoads, New York, gave the seventh annual Barnard Hospital Lecture in the auditorium of the St. Louis Medical Society, November 20. His subject was "Nutritional Aspects of the Cancer Problem."

Pilgrimage to Beaumont Grave.—The St. Louis Medical Society on Thanksgiving Day, November 22, resumed its annual pilgrimage to William Beaumont's grave in Bellefontaine cemetery. Philip A. Shaffer, Ph.D., dean of Washington University School of Medicine, St. Louis, gave the address.

NEW YORK

New Clinic for Children with Cerebral Palsy.—A newly created clinic for children suffering from cerebral palsy has been established at Strong Memorial Hospital in cooperation with the orthopedic and pediatric departments of the hospital and the University of Rochester School of Medicine and Dentistry cooperating. Ten hospital beds will be set up. Physical examinations in the clinic will be coupled with psychiatric tests, and home treatment will be outlined for ambulatory patients. Those needing hospital treatment will be brought into the new hospital division and when able will be moved to the Convalescent Hospital for Children on Beach Avenue. Arrangements have been completed for financial aid to parents unable to meet the cost of hospitalization or treatment.

John Bourke to Direct State Hospital Service.—Dr. John J. Bourke, Albany, on terminal leave as chief medical officer on a Coast Guard assault vessel and formerly deputy director of the State Legislative Health Preparedness Commission, has been appointed director of the statewide survey

of hospital facilities, which was to start about November 15 for the state joint hospital board. Robert T. Landsdale, commissioner of the state department of social welfare, is chairman of the joint hospital board which was recently appointed by Governor Thomas E. Dewey to prepare a state hospital inventory and survey of needed hospital construction. Other members include Dr. Edward S. Godfrey Jr., Albany, commissioner of the state department of health; Dr. Frederick MacCurdy, commissioner of the state department of mental hygiene, as vice chairman, and Assemblyman Lee Mailler as adviser. The joint hospital board is acting for and with the planning commission in making the survey. Governor Dewey, in designating the planning commission as the single agency responsible for the inventory, and in creating the Joint Hospital Board to act with the commission, was acting in accordance with the provisions of the federal hospital construction bill, known as the Hill-Burton bill, just reported to the U. S. Senate from the Committee on Education and Labor. Dr. Bourke's headquarters will be in the offices of the State Post-war Public Works Planning Commission, State Office Building, Albany.

New York City

Conference on Fertility.—The annual conference on fertility of the National Committee on Maternal Health will be held at the Hotel Commodore, February 1-2. Two major topics will be considered, one on the Detection and Induction of Ovulation and the other on Sperm Biology, with particular reference to sperm migration in relation to the female genital tract. The speakers will include investigators from the fields of animal husbandry and from clinical and laboratory studies related to man.

William Schmidt Associated With Joint Distribution Committee.—Dr. William M. Schmidt, formerly medical director for the New York region of the Children's Bureau, U. S. Department of Labor, Washington, D. C., is en route to Europe to supervise the health and medical services on the continent of the Joint Distribution Committee, it was announced December 3. The health activities of the Joint Distribution Committee are an integral part of the extensive relief and rehabilitation program carried out by eighty field workers of the committee in every country of Europe.

Progress of Eye Bank.—About sixty hospitals in nine states are currently cooperating with the Eye Bank for Sight Restoration, 210 East 64th Street, New York. In Greater New York alone, thirty-two hospitals are associated in the movement to make available for distributing healthy corneal tissue for those whose sight may be restored through corneal graft operations by which ocular opacity is overcome, the announcement stated. In addition, eight hospitals in other New York State cities, together with six in New Jersey, three in Connecticut and one each in six other states, have become actively affiliated with the movement. Organized only last February, the eye bank was established for the collection, preservation and distribution of healthy corneas, which may be obtained only from persons either living or immediately after death. As corneas may be preserved and utilized for transplanting to the eyes of others for only seventy-two hours, speedy collection and distribution are essential as soon as they are obtained. Whenever cooperating hospitals have eyes available, the Red Cross Motor Corps rushes them to the Eye Bank for distribution to persons requiring the corneal graft operation.

NORTH CAROLINA

Personal.—Dr. Robert T. Stimpson, Raleigh, director of the Bureau of Vital Statistics of the state board of health since 1934, resigned October 1 to go into general practice in Winston-Salem. Dr. George F. Baier Jr. has resigned as coroner of Buncombe County.

Psychologist Named in New Program.—Donald S. Carter, New York, has been named clinical psychologist for the state mental hospitals in North Carolina, newspapers report. The appointment marks the first time a full time clinical psychologist has been named in the state's mental program. The appointment was announced to the press by Dr. David A. Young, general superintendent of mental health for the state hospitals of North Carolina, also a newly created position (THE JOURNAL, July 14, p. 819). Mr. Carter will have a permanent office in the state hospital in Raleigh.

Physician Named to Direct Surplus Properties Program.—Dr. Sylvester D. Craig, Winston-Salem, president of the North Carolina State Board of Health, has been named to direct the surplus properties program of the North Carolina State Board of Health. Dr. Craig will act as liaison officer

in the handling of matters affecting surplus government property that can be used by hospitals and public health agencies in North Carolina. He will advise with hospitals and health agencies on what suitable surplus property is available, complete their needs and requests, and transmit the information to the proper authorities in Washington.

OHIO

John Caughey Appointed Assistant Dean.—Dr. John L. Caughey Jr., New York, who has for four years been studying the human constitution in relation to disease at Presbyterian Hospital, New York, has been named assistant dean at Western Reserve University School of Medicine, Cleveland, a newly created position. Dr. Caughey will supervise admissions and keep in touch with the progress of the students. He will also continue his research.

Prentiss Award Goes to Charles Winslow.—The Elisabeth S. Prentiss National Award in health education for 1945 was presented to Charles-Edward A. Winslow, Dr. P.H., New Haven, Conn., during a special program at the Cleveland Health Museum, November 27. The principal address was given by Dr. Winslow on "Ten Unattained Goals of Public Health." Dr. Robert L. Dickinson, New York, who was guest of honor, spoke on "Sex Education—Sex Evolution." The program also included James R. Angell, New Haven, Conn., president emeritus, Yale University School of Medicine, and Dr. William W. Peter, Washington. This was the second award of the Prentiss Prize (THE JOURNAL, Jan. 15, 1944, p. 181; Nov. 18, 1944, p. 781).

Advisory Committee on Child Hygiene.—Dr. Roger E. Heering, state health commissioner, has appointed an advisory committee to the division of child hygiene of the Ohio State Department of Health, following consultation with the council of the state medical association. Members of the committee include Dr. James G. Kramer, Akron; Dr. Robert A. Lyon, Cincinnati; Dr. Loyal E. Leavenworth, Canton; Dr. Dana W. Cox, Columbus; Dr. John A. McNamara, Marion, and Dr. Herbert D. Chamberlain, McArthur. The committee will act in an advisory capacity to the division, of which Dr. Susan P. Souther, Columbus, is director, on matters of policy and procedure in the operation of the department's maternal and child hygiene programs.

WASHINGTON

John Fouts Named Health Officer of King County.—Dr. John D. Fouts, London, Ky., has been appointed health officer of King County, filling the vacancy that occurred when Dr. Emil E. Palmquist accepted an appointment as city health commissioner of Seattle (THE JOURNAL, July 28, p. 964).

New Editors.—Dr. Robert N. Rutherford, Seattle, is the new editor of the *Western Journal of Surgery, Obstetrics and Gynecology*, succeeding Dr. Goodrich C. Schaufliker, Portland, Ore. Dr. Joseph M. Aspray, Spokane, has been appointed editor of the Bulletin of the Spokane County Medical Society.

State Medical Board.—Gov. Mon C. Wallgren recently appointed Drs. Alexander Grinstein, Seattle, Thomas Ingham, Olympia, and John C. Lindsay, Ritzville, as members of the Washington State Board of Medical Examiners. Retiring members are Drs. Philip C. Kyle, Tacoma; David McHenry, Seattle, and Robert L. Rotchford, Spokane.

Blood Bank Building.—Ground was broken by Mayor William F. Devin of Seattle for the new home of the King County Central Blood Bank. The building is to be constructed on the southwest corner of Terry Avenue and Madison Street on property donated by Dr. Simon Maimon Samuels, Seattle (THE JOURNAL, June 23, p. 606). The blood bank recently completed its first anniversary.

WEST VIRGINIA

Financial Responsibility of Cancer Care.—The West Virginia State Department of Public Assistance will be responsible for payment for care of any case of cancer referred by it to any hospital or placed under the care of a doctor up to the point at which responsibility for such care and treatment is assumed by the division of cancer control of the state health department. When information is received from the division of cancer control that a case is incurable, the department of public assistance will assume the cost of necessary palliative treatment or other necessary care if the patient meets the eligibility requirements of the department. In all cases the assumption of responsibility for care of incurable cases by the department will depend on the economic eligibility of the indi-

vidual as measured by department standards. The determination of such incurability will be made by the division of cancer control. The new regulations, which are effective immediately, have been agreed on by Mr. Robert F. Roth, director of the department, and Dr. Paul R. Gerhardt, director of the division of cancer control.

GENERAL

Conference of Presidents.—A Conference of Presidents of the state medical societies called by the California and Michigan state medical societies in Chicago, December 2, elected Dr. Andrew S. Brunk, Detroit, president. Dr. Philip K. Gilman, San Anselmo, Calif., was named president-elect and Mr. Harvey T. Sethman, Denver, was chosen secretary-treasurer.

Christopher Shaw Named Educational Director for College of Physicians.—Dr. Christopher C. Shaw, formerly of Bellows Falls, Vt., has been appointed educational director of the American College of Physicians, effective November 1. The position is a newly created one. Dr. Shaw, under the executive secretary of the college, has immediately taken over the direction of the postgraduate courses, research fellowships, clinical fellowships, program for the aid of members returning from the armed services and other educational features in the college program. Dr. Shaw was recently separated from active duty in the Navy.

Change in Examination in Ophthalmology.—As a result of transportation difficulties the examination of the American Board of Ophthalmology originally scheduled to be held in Los Angeles, January 28-31, has been changed to San Francisco, June 22-25. Other examinations will be Chicago, January 18-22; New York, about April 10-13, and Chicago, October 9-12. A new ruling requires that previously accepted candidates mail their lists of surgery to the board office at least sixty days prior to their examination. All new applicants are now required to send their list with their application. Dr. S. Judd Beach, Portland, Maine, is secretary-treasurer of the board.

New Assistant Medical Director for Infantile Paralysis Foundation.—Dr. Hart E. Van Riper, who since March 1944 has been medical director of the James M. Jackson Memorial Hospital, Miami, Fla., has been appointed assistant medical director of the National Foundation for Infantile Paralysis as assistant to Dr. Don W. Gudakunst, New York, medical director. Dr. Van Riper will supervise the foundation's extensive program of medical care and treatment for infantile paralysis patients throughout the United States. A graduate of the University of Pennsylvania School of Medicine, Philadelphia, in 1930, Dr. Van Riper served in 1941 as assistant director for maternal and child health in the division of health services of the U. S. Department of Labor.

National Physicians Committee Holds Annual Conference.—The National Physicians Committee for the Extension of Medical Service held its sixth annual conference of the professions and industries on the extension of medical service, group insurance programs and prepayment medical care plans. The meeting was at the Waldorf-Astoria, New York, November 26. Among the speakers on the program were Dr. Claude Robinson, Princeton, N. J., "What People Think About the Distribution of Medical Care and Payment of Costs"; Herbert D. Simpson, Ph.D., Evanston, Ill., "Preliminary Report on Nationwide Study of Physician Sponsored Medical Care Plans," and Dr. Morris Fishbein, Chicago, "Federal Subsidy for Hospitals and Scientific Research—Pending Legislation—Postwar Medical Service—Position and Prospects." The morning session was addressed by Mr. Edward F. Stegen, associate administrator of the National Physicians Committee, on "Physician Cooperation and Support."

Borden Undergraduate Awards.—The annual award of \$500 for excellence of research has been established at twenty-two medical schools in the country in an effort to assist the schools in developing a greater interest among undergraduates in medical research. The first school to make the award in the program is Duke University (*THE JOURNAL*, September 15, p. 223). Other universities which are participating in the program are California, Chicago, Columbia, Cornell, Harvard, Iowa, Johns Hopkins, Michigan, Minnesota, New York, Northwestern, Ohio, Pennsylvania, Rochester, Stanford, Tulane, Vanderbilt, Washington, Western Reserve, Wisconsin and Yale. The Borden Foundation has deposited \$2,500 with each university, with the understanding that the sum will be used by the university to establish an annual award to be known as the Borden Undergraduate Research Award in Medicine. Only one award of \$500 is to be made during any one calendar year, and the awards will be made for a period of not less than five years.

Van Meter Prize Award.—The American Association for the Study of Goiter again offers the Van Meter Prize Award of \$300 and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The award will be made at the annual meeting of the association, which will be held in Chicago in April or May 1946, provided essays of sufficient merit are presented in competition. The competing essays may cover either clinical or research investigations, should not exceed three thousand words in length, must be presented in English, and a typewritten double spaced copy sent to the corresponding secretary, Dr. Thomas C. Davison, 207 Doctors Building, Atlanta 3, Ga., not later than February 20. A place will be reserved on the program of the annual meeting for presentation of the prize award essay by the author if it is possible for him to attend. The essay will be published in the annual proceedings of the association. This will not prevent its publication, however, in any journal selected by the author.

Society News.—A joint conference will be held in Chicago, April 8-13, by the American Association of Industrial Physicians and Surgeons, the American Industrial Hygiene Association, the National Conference of Governmental Industrial Hygienists, the American Association of Industrial Nurses and the American Association of Industrial Dentists.—The next international assembly of the Interstate Postgraduate Medical Association of North America will be held at the Cleveland Public Auditorium, Cleveland, October 15-18.—The Federation of American Societies for Experimental Biology will meet in Atlantic City beginning March 11. The federation is composed of the American Physiological Society, the American Society of Biological Chemists, the American Society for Pharmacology and Experimental Therapeutics, the American Society for Experimental Pathology, the American Institute of Nutrition and the American Association of Immunologists.—The eleventh annual meeting of the Mississippi Valley Medical Society will be held September 25-27 at the Hotel Jefferson, St. Louis. Owing to the fact that no meeting was held in 1945, all the officers of the society have been retained for another year. These include Drs. Grayson L. Carroll, St. Louis, president; Walter A. Sternberg, Mount Pleasant, Iowa, president-elect; Louis H. Jorstad, St. Louis, Elmer E. Nystrom, Peoria, Ill., and Ernest J. Lessenger, New London, Iowa, vice presidents, and Harold Swanberg, Quincy, Ill., secretary-treasurer.

Special Society Elections.—Mr. Basil O'Connor, chairman, American Red Cross, was elected chairman of the board of governors of the League of Red Cross Societies at a recent three day meeting in Paris, the first since 1938. Although the meeting was called for the purpose of electing officers and planning the peacetime program of the league, its primary concern was rebuilding the worldwide character of the Red Cross movement by revitalizing the member societies, some of which are now struggling for existence in the wake of war.—At the annual meeting of the Western Surgical Association in Chicago, November 30-December 1, Dr. Arthur R. Metz, Chicago, was named president; Drs. Herbert H. Davis, Omaha, and LeRoy B. Sherry, Pasadena, Calif., vice presidents; Dr. Warren H. Cole, Chicago, secretary, and Dr. William M. Mills, Topeka, Kan., treasurer. The 1946 meeting of the association will be held in Memphis, Tenn., December 9-11.—At the third annual meeting of the American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery, Inc., November 15, the following officers were chosen: Drs. Alfred Schattner, New York, president; Jacob Daley, New York, vice president; Benjamin H. Shuster, Philadelphia, treasurer, and Norman N. Smith, New Haven, Conn., secretary.—Dr. William S. McElroy, Pittsburgh, was chosen president-elect of the Association of American Medical Colleges during its annual meeting in Pittsburgh October 29-31. Dr. John W. Moore, Louisville, was installed as president. Other officers included Joseph C. Hinsey, Ph.D., New York, vice president; Dr. Fred C. Zapffe, Chicago, secretary, and Dr. Arthur C. Bachmeyer, Chicago, treasurer. The 1946 meeting will be held in New Orleans October 28-30.

CORRECTION

Intravenous Anesthesia for Orthopedic Surgery.—In the article by Dr. George J. Thomas in *THE JOURNAL*, November 17, under "Complications and Their Management" on page 791 and in line 9 of this paragraph, "oxide and nitrogen" should read "oxide and oxygen," the sentence reading "However, occasionally it is found necessary to administer nitrous oxide and oxygen."

A New British Antimalarial Drug

The loss of Java early in the war resulted in a worldwide shortage of quinine. Much was done in this country and the United States to find new drugs for the treatment of malaria. A new drug has been discovered in the laboratories of the Imperial Chemical Industries, a British firm, which is to be distributed under the name of paludrine. Its composition is not disclosed but the following information was reported to the Medical Research Council during the development of the substance. Early in 1942 a group of chemists and biologists began the search for a new synthetic antimalarial drug which could not only replace quinine but be more effective in preventing and treating malaria. Antimalarial activity was found in several compounds, but not until 1944 was a satisfactory compound synthesized. It was remarkably active against experimental infections of chicks with *Plasmodium gallinaceum* and other forms of avian malaria. Successful clinical trials were made at the Liverpool School of Tropical Medicine by Dr. A. R. D. Adams and Professor T. H. Davey. Supplies of the compound were sent by air to Australia, where its action in preventing malaria in volunteers exposed to infected mosquitoes was investigated. Other studies are in progress in medical schools in Britain and in India.

The new compound is a white powder which does not cause yellowing of the skin, as does mepacrine hydrochloride. The chemical formula is simple and differs fundamentally from other antimalarials. It is rapidly absorbed when given by mouth but excreted slowly, about a third in the urine. It is well tolerated in doses up to 0.5 Gm. twice daily. Gastrointestinal irritation is the only untoward effect so far observed from large doses. This reaction can be avoided by dividing the dose. The treatment is doses of the drug twice a day for fourteen days. The smallest amount that will terminate an attack of benign tertian malaria appears to be 10 to 50 mg., a fifteenth of the maximum tolerated dose. Unfortunately (as with quinine and mepacrine hydrochloride) relapses are frequent. The response of malignant tertian malaria is similar but relapses are less frequent. The effect on quartan malaria has not yet been studied. As a preventive paludrine seems equal or superior to mepacrine hydrochloride and much superior to quinine.

Fiftieth Anniversary of Roentgen's Discovery

The fiftieth anniversary of Roentgen's discovery of the x-rays was commemorated by an all day conference of the Royal Society attended by British, Swedish, French and Dutch scientists. The president, Sir Henry Dale, remarked that much of the early interest in the discovery centered in its potential value to medicine and surgery, a value that has steadily grown. To physical science it was a discovery which has revolutionized fundamental concepts of physics and chemistry, which have culminated in nuclear fission. Physics at the end of 1895 was regarded as an exact science presenting a field of knowledge in which it was unlikely that any startling new chapter would be opened. The discovery of the x-rays came as a stimulating shock to this attitude.

Sir Lawrence Bragg brought to the meeting two reprints dedicated and sent to J. J. Thomson by Roentgen, their author. They were dated December 1895 and March 1896. The earlier paper contained a measurement of the relative transparency to x-rays of different materials. It showed the

bones of the hand and a compass visible through a metal box. These papers showed that Roentgen realized the implications of what we are likely to regard as a chance discovery.

At a meeting held at the Royal Society of Medicine the minister of health, Mr. Bevan, honored the devoted band of workers who had suffered death and injury in applying and developing Roentgen's discovery. It is noteworthy that not one of Roentgen's countrymen were present at either of these functions.

Honor for an American Pathologist

The Parkes Weber prize and medal of the Royal College of Physicians has been awarded to Dr. Eugene L. Opie, professor of pathology, Cornell University, for his work on the pathogenesis of tuberculosis of the lungs.

Antagonists of Histamine

In such conditions as urticaria, asthma, eczema and herpes, in arsenical erythrodermia and in pruriginous lesions the intervention of a histamine factor must be taken into consideration. The histamine factor plays a part also in the production of visceral infarcts. In the blood of a patient affected by urticaria and Quicke's edema, Cerqua and Gajdas have discovered histamine in amounts of 200 to 300 micrograms per liter as against 30 to 60 micrograms per liter in the normal physiologic state.

In 1940 Halpern proved the antihistamine action of antergan, or 2339 R. P., since employed by clinicians with variable results. Antergan acts in serum accidents so that pruritus disappears half an hour after treatment; but arthralgias are more resistant. In two thirds of the cases of urticaria the results are favorable, especially in alimentary urticaria. Good results are also obtained in acute eczema, with less uniform achievements in the sub-acute and chronic forms. Antergan also acts favorably on medicinal dermatosis. In asthma (particularly as a preventive measure) from one third to one half of the cases are benefited. In migraine, results are not uniform. No results have been obtained in traumatic shock, postoperative shock and shock from burns. Antergan is often poorly tolerated and causes digestive and nervous disturbances: gastric burns, anorexia, nausea or vertigo. Children tolerate it better than adults. Recently at the Société de biologie, Bovet, Horelois and Walthert described experiments made on guinea pigs with a new antagonist of histamine: neoantergan, or 2786 R. P., which is less toxic, more active and better tolerated. The dosage of 1 to 10 mg., as against 20 mg. of antergan, protects the guinea pig against anaphylactic (or histamine) shock. The authors remarked also that neoantergan in the guinea pig impedes or diminishes the increase of permeability of cutaneous capillaries caused by an intradermal injection of histamine. At a meeting of the Société médicale des hôpitaux de Paris, Decourt described the clinical results obtained with neoantergan. He has found that its activity in man is three times greater than that of antergan. To attenuate untoward reactions of neoantergan it is necessary to start with a small dose, for adults 0.1 Gm. orally administered during meals and then to increase the doses rapidly (as a rule to 0.6 or 0.8 Gm. daily). The doses vary to a great extent from one patient to another and from day to day in the same patient. In case of nontolerance (nausea and gastric spasms) the original dose of 0.1 Gm. three times daily during meals should be renewed until it is well tolerated (as a general rule from twenty-four to forty-eight hours). Interrupted treatment is begun again with a small dose. It is possible to use the parenteral route for administration of neoantergan. With neoantergan, 90 per cent of the cases of asthma show improvement without using poorly tolerated doses.

Synthetic antihistaminic does not prevent the release of histamine but seems to render the tissues incapable of reacting to histamine (a similar phenomenon characterizes the atropine-acetylcholine antagonism). Neoantergan shows an analogous chemical structure to histamine, and it is possible that this action is a phenomenon of competition.

In October 1945 at the sixty-fourth congress of the French Association for the Advancement of Sciences, Halpern disclosed, in his lecture on "Synthetic Antihistamine," that he is now making experiments on animals with a new antihistaminic product, 3015 R. P. This new product belongs to the same series as antergan and neoantergan but contains neither aniline nor pyridine. The author did not, in this lecture, reveal its chemical formula. In the guinea pig this product showed an antihistaminic power from eight to ten times higher than that of neoantergan.

Intravenous Procaine Hydrochloride

Intravenous procaine hydrochloride, 5 to 10 cc. of 1 per cent solution, is often employed to diminish the pathologic effect of histamine. Justin Bezançon and R. Fleury used procaine 5 cc. intravenously in herpes and postherpetic pain. This treatment alleviates the pain in recent herpes but does not affect the evolution of the herpes. Intra-arterial procaine is also employed in the treatment of embolism and thrombosis. In order to be efficacious, this treatment must be begun as early as possible.

Vitamin D₂ for Lupus Vulgaris

Charpy of Dijon has developed a method of treating tuberculosis of the skin with strong doses of vitamin D₂ and calcium gluconate. Charpy prescribes 5 mg. of vitamin D₂ and 1 to 2 liters of milk daily or 0.5 Gm. of calcium gluconate by mouth twice daily. The patient is placed on a salt poor diet. As a rule the treatment lasts three months. The author was successful in all of the 38 cases treated. In the *Revue médicale française* Gougerot and Gaullier mention only 3 failures in 21 cases treated. Degos explained his modification of Charpy's technique: He prescribes in the first week three doses of 15 mg. of vitamin D₂, the two following weeks two doses, then one dose weekly for sixteen weeks, and calcium gluconate 0.5 Gm. twice daily. The best results are obtained in lupus vulgaris; this treatment is far less efficacious in other forms of cutaneous tuberculosis. In order to avoid accidents such as sclerosis, arterial calcification or the possible toxic action of strong doses of D₂, the authors stress the use of vitamin D₂ chemically pure in alcoholic solution. The oil solution is less active or inactive.

Application of Electroencephalography in Legal Medicine

At the sixty-fourth Congress of the French Association for the Advancement of Science, held in October, A. Baudoin, dean of the Faculté de médecine, and Fischgold discussed the rational use of electroencephalography in legal medicine. Several preliminary conditions must be considered, such as the standardization of the technique of recording, a clear definition of the normal rhythm and its alterations, knowledge of metabolic factors (glycemia 0.002) which control the cerebral rhythm and a consideration, on the basis of extensive statistics, of the percentages of normal and abnormal tracings in disorders pertaining to legal medicine. Legal medicine can, however, profit by the use of the electroencephalographic technique in doubtful cases of epilepsy. In persons said to have nonverified crises of grand mal the presence of wave and spike (*pointes ondes*) tracings will indicate grand mal, whereas a normal tracing taken immediately after an alleged crisis will make certain patients open to suspicion as malingerers. In subjects showing abnormal psychic behavior a tracing with waves and spikes will indicate epilepsy; whereas a normal

tracing is not conclusive. In statistics comprising all forms of epilepsy, Gibbs and Lennox find that 29.3 per cent of the epileptic show wave and spike tracings, 28.7 per cent show abnormal tracings and 32 per cent reveal tracings which are normal or within the limits of normal. According to Baudoin, Fischgold and Remond, in cases of idiopathic grand mal in young patients examined immediately after a crisis only 2 per cent show normal tracings.

In cases of head injuries the results of electroencephalographic examinations must be compared with special examinations: radiography of the skull, examination of the fundus of the eye and of the acoustic nerve and of pneumography. The normal or abnormal tracing must be interpreted on the basis of previously established statistics.

According to Puech, Fischgold and G. and J. Verdeaux the statistics reveal that there is an improvement of the tracing in the year following the trauma. Thirteen per cent improve in the first fifteen days, with the normal rate rising to about 50 per cent by the end of the first year. If epilepsy occurs there is a reappearance of the anomalies; on the other hand, a subjective syndrome alters the tracing far less. Evident alterations are to be found in 8 per cent of the totally cured traumatic patients, in 20 per cent of those showing a subjective syndrome and in 33 per cent of the traumatic patients. The alteration does not have absolute value, but its presence renders more or less probable the organic basis, the severity and the existence of the post-traumatic syndrome.

In carbon monoxide intoxication the tracing remains altered for a variable period; its normalization accompanies either a cure or definitive lesions. The greatest care is necessary in the interpretation of the tracings and the practical conclusions which can be derived from them.

Nov. 5, 1945.

First Inter-American Meeting on Typhus

The first Inter-American Meeting on Typhus, sponsored by the Mexican Secretariat of Public Health and Welfare, by the Institute of Inter-American Affairs and by the Pan American Sanitary Bureau in Washington, D. C., and organized by the Mexican Typhus Fever Commission, was held in Mexico City during the week of October 7 to 13. The sessions were held in the School of Public Health and Hygiene, with the exception of one, which took place in the typhus laboratory of the City General Hospital.

The opening session was presided over by Dr. Francisco Castillo Nájera, secretary of foreign relations, Mr. Jaime Torres Bodet, secretary of public education and Dr. Manuel Martínez Baez, undersecretary of public health and welfare and president of the Mexican Typhus Committee. Dr. Miguel E. Bustamante, epidemiologist of the Institute of Health and Tropical Diseases, introduced the distinguished guests and other scientists. Dr. Rolla E. Dyer, director of the National Institute of Health in Bethesda, Md., and president of the Pan American Typhus Commission, summarized what had been done in the study and treatment of the rickettsial diseases.

In the Monday session, general reports on the status of rickettsial diseases in the American continent were made by Drs. Juan Antonio Montoya, member of the Pan American Typhus Commission, Gerardo Varela of the Mexican Committee on Typhus, Julio Roberto Herrera of Guatemala, Luis Patiño Camargo of Colombia, Attilio Machiavello of Ecuador, who represented several South American countries on the Pacific Coast, Eugenio Suarez from the republic of Chile, Norman H. Topping of the National Institute of Health in Bethesda, Md., and several others.

The sessions held on Tuesday, Wednesday and Friday were devoted to the reading of papers, discussion and comments on the epidemiology of typhus, procedures and methods for the diagnosis of rickettsiosis, the pathology, hematology, symptomatology, therapeutics and prophylaxis of typhus and other rickettsial diseases, problems of nomenclature and reports on the present knowledge of rickettsiosis and on the control of typhus during war.

Among the delegates of the United States who attended the meeting were Drs. Rolla E. Dyer and Norman H. Topping of the National Institute of Health in Bethesda, Md.; Drs. Joseph E. Smadel and Arthur C. Allen of the United States Army and Otto L. Burton of the United States Navy; Drs. Hugh H. Smith and Fred L. Soper of the International Health Division of the Rockefeller Foundation; Col. John D. Yeagley and Drs. Charles L. Von Poole and Theodore L. Gandy of the Institute of Inter-American Affairs, Washington, D. C.; Dr. R. R. Parker of the Rocky Mountain Laboratory, Hamilton, Mont.; Dr. Herald R. Cox of the Lederle Laboratories, Pearl River, N. Y.; Dr. Fred Stimpert of the Biological Research Laboratory, Parke, Davis & Co., Detroit; Drs. H. H. Stage and E. F. Knipling of the Department of Agriculture, Washington, D. C.; S. H. Bohles of the Texas State Health Department; Dr. Federico Musacchio, local health officer in Laredo, Texas; Drs. George R. Hermann and Ludwig K. Agnistein of the University of Texas Medical Branch; Dr. Malcolm H. Soule from the University of Michigan Medical School; Dr. Gustave Freeman from the University of Chicago School of Medicine; Dr. James A. Reyners of the University of Notre Dame; Dr. Leslie A. Chambers of the University of Pennsylvania School of Medicine; Dr. Henry A. Pinkerton from the St. Louis University School of Medicine and Dr. Harold A. Wood, Attilio Machiavello and Juan Antonio Montoya of the Pan American Sanitary Bureau's Typhus Commission.

Delegates from the Latin American republics were Dr. Eugenio Suarez of Chile, Dr. Roberto Nevares Vázquez of Ecuador, Dr. Luis Patiño Camargo of Colombia, Dr. Antonio Trucha Colominos from the Dominican Republic, Drs. Julio Roberto Herrera, Enrique Padilla, Carlos Tejeda and Daniel Jobbins, all of Guatemala, Dr. Roberto R. Boice of El Salvador, Drs. Arturo Curbelo, Alberto Recio and Guillermo Lage from Cuba and, from Mexico, Dr. Manuel Martínez Baez, undersecretary of public health and welfare, and Dr. Guillermo Román y Carrillo, professor of epidemiology in the School of Health and Hygiene, president and secretary of the Mexican Typhus commission, respectively; Dr. Maximiliano Ruiz Castañeda and Roberto Silva Goytia of the Typhus Laboratory; Luis Vargas, Gerardo Varela, Miguel E. Bustamante and Alberto P. León of the Institute of Health and Tropical Diseases; Carlos Ortiz Mariotte from the Division of Epidemiology; Samuel Morones and Santiago Castro Estrada, professors of communicable diseases in the School of Public Health and Hygiene; José Bustos, state health officer in the state of Veracruz; Alfonso Angelini, epidemiologist of the Federal District Health Office; George A. Payne, representative of the International Health Division, and E. Harold Hinman, representative of the Institute of Inter-American Affairs, both in Mexico, and Dr. González Guzmán, dean of the Faculty of Medicine.

Among the recommendations made are (1) prophylaxis by the use of dead germs, vaccines for immunization against typhus and other rickettsial diseases and the eradication of insects and delousing of animals, (2) the appointment of a technical inter-American committee for the study of a uniform and coordinated nomenclature, (3) the recording of rickettsial diseases and (4) the organization of a special department to deal with the control of rickettsial diseases with laboratory facilities for diagnosis in countries where such diseases prevail.

The Pan American Typhus Commission held three joint sessions, which were presided over by Dr. Rolla E. Dyer, president, and Dr. Juan Antonio Montoya, acting secretary.

Dr. Gustavo Baz, secretary of public health and welfare, presented the members of the meeting with a silver medal on which were engraved the figures of Ricketts, Nicolle and Zinsser. Reprints of a book entitled "Two Studies on Typhus" by the late Mexican clinician Dr. Miguel Jiménez, which was issued in 1876, were distributed.

The Fiftieth Anniversary of the Death of Louis Pasteur

The commemoration of the fiftieth anniversary of the death of the French scientist Louis Pasteur, organized by the Mexican Society of Natural History under the auspices of President Manuel Avila Camacho, Dr. Gustavo Baz, secretary of public health and welfare, Mr. Jaime Torres Bodet, secretary of public education, Mr. Marte R. Gómez, secretary of agriculture, Mr. Javier Rojo-Gómez, governor of the Federal District, Mr. Genaro Fernández-MacGregor, dean of the National University of Mexico, and Mr. Maurice Garreau Dombate, French ambassador, was celebrated during the week of September 24 to 30. The unveiling of pictures and plates of Pasteur took place in the General Hospital, in the National Institute of Hygiene, Pópotla, D. F., and in the Faculty of Medicine. A public meeting was held on Saturday morning the 28th before the Pasteur Memorial in Cuauhtemoc Square; the final ceremony took place in the Bcaux Arts Theater on September 30, presided over by Dr. Baz. Ambassador Garreau Dombate, Dr. Manuel Martínez Baez, undersecretary of public health and welfare, and Professor Enrique Beltrán, secretary of the Mexican Society of Natural History, spoke on the life of Louis Pasteur and on the importance of scientific research from the social point of view. A large edition of the Biography of Louis Pasteur, written by Dr. Alfonso Pruneda, life secretary of the National Academy of Medicine, was distributed among the people.

Mexican Delegation to the Second International Conference on Agriculture and Nutrition

On October 12 Drs. Manuel Martínez Baez, undersecretary of public health and welfare, and Francisco de Paula Miranda, director of the National Institute of Nutrition, took one of the Pan American clippers for Quebec to attend, as members of the Mexican delegation, the second International Conference on Agriculture and Nutrition, to be held in Quebec.

Marriages

EDWARD B. MARENUS, Shamokin, Pa., to Miss Frances Barbara Kremer of Highland Park, N. J., September 20.

LONGSTREET CAVETT HAMILTON, Jackson, Miss., to Miss Johnette Blackledge of Laurel in New Orleans recently.

JOHN JAMES SMITH, Rahway, N. J., to Dr. Rosemary Veronica Gorman of Kingston, N. Y., November 28.

TERRY E. LILLY JR., Kansas City, Mo., to Miss Lillian Ethel Townsend in Lebanon, N. H., November 18.

Cecil JENNINGS HAWES, Conway, S. C., to Miss Ann Jackson Brattan of Woodbury, Tenn., October 6.

JOSEPH MARTIN FORD, Huntington, W. Va., to Miss Eliot James of New York, November 22.

THOMAS KERR LAIRD to Miss Ruth Lee Carper, both of Montgomery, W. Va., at Pocahontas, Va., November 15.

CHARLES M. SLAFFER to Miss Vivian Maxine Watson, both of Carlisle, Pa., October 18.

JACK R. JARVIS, Towson, Md., to Miss Mary Irene Gracy in Lakeland, Fla., September 6.

STANLEY MARGOSHES, Lancaster, Pa., to Miss Doris Smith of Brooklyn, November 16.

Deaths

Guy Whitman Leadbetter * Washington, D. C.; born in Bangor, Maine, in 1893; Johns Hopkins University School of Medicine, Baltimore, 1920; clinical professor of surgery at George Washington University School of Medicine; specialist certified by the American Board of Orthopaedic Surgery, Inc.; member of the American Orthopaedic Association; president-elect of the American Academy of Orthopaedic Surgeons; secretary of the committee on orthopedic surgery of the National Research Council; orthopedic consultant to the Secretary of War during World War II; known for original work on the reduction of the fracture of the neck of the femur; on the staffs of the Children's Hospital, Washington Sanitarium and Hospital, George Washington University Hospital, Gallinger Municipal Hospital and the Providence Hospital; chief, orthopedic service, Central Dispensary and Emergency Hospital, where he died November 11, aged 52, of coronary occlusion.

Kendal Phelps Frost * Los Angeles; Rush Medical College, Chicago, 1916; born in Los Angeles on Nov. 9, 1890; clinical professor of medicine (dermatology) at the University of Southern California School of Medicine; specialist certified by the American Board of Dermatology and Syphilology; member of the American Dermatological Association, the Los Angeles Academy of Medicine and the American Academy of Dermatology and Syphilology; fellow of the American College of Physicians; served during World War I; attending dermatologist at the Hospital of the Good Samaritan and St. Vincent's Hospital; chairman of the department of dermatology and syphilis, Los Angeles County General Hospital; consulting dermatologist, Children's Hospital and the Santa Fe Coast Lines Hospital; died September 27, aged 54, of malignant hypertension.

Clement R. Jones * Pittsburgh; Columbus Medical College, 1892; born in Waynesburg, Ohio, Nov. 30, 1871; assistant professor of medicine at the University of Pittsburgh School of Medicine; professor of the principles of medicine, University of Pittsburgh School of Dentistry; certified by the American Board of Internal Medicine; member of the American Gastro-Enterological Association; fellow of the American College of Physicians, of which he had been treasurer and ex-regent; served as president of the American Therapeutic Society; on the staffs of the Pittsburgh City Home and Hospital, Mayview, Mercy and Presbyterian hospitals and Falk Clinic; died September 3, aged 73.

Samuel William Spencer Toms * Nyack, N. Y.; born in Elyria, Ohio, Dec. 11, 1861; University of Buffalo School of Medicine, 1891; member of the American Academy of Ophthalmology and Otolaryngology; member of the House of Delegates of the American Medical Association in 1911, 1913 and 1914; fellow of the New York Academy of Medicine; served as health officer of South Nyack; on the staff of the Nyack Hospital; captain, medical reserve corps, U. S. Army, not on active duty; member and formerly chairman of the publication committee of the *New York State Journal of Medicine*; died August 22, aged 83, of generalized arteriosclerosis.

Fred Dundas Jackson, Detroit; Detroit College of Medicine and Surgery, 1921; associate professor of clinical medicine at his alma mater, now known as the Wayne University College of Medicine; served during World War I; director of the outpatient department at the Receiving Hospital for many years; on the staffs of the Alexander Blain, Florence Crittenton and Providence hospitals; formerly in charge of the medical division of the Franklin Street Settlement Clinic; died in the U. S. Marine Hospital July 31, aged 54, of arteriosclerotic heart disease.

Joseph Bruce Alexander, Mansfield, Ohio; Eclectic Medical College, Cincinnati, 1918; formerly associate professor of surgical anatomy and principles of surgery at his alma mater; died in Cincinnati August 22, aged 57.

William Simon Ankenbroek, Indianapolis; Indiana University School of Medicine, Indianapolis, 1924; member of the American Medical Association; captain, medical corps, Army of the United States, not on active duty; on the staffs of St. Vincent's, Methodist and City hospitals; died September 28, aged 49, of cerebral hemorrhage.

Edward Louis Artman, Milwaukee; University of Pennsylvania School of Medicine, Philadelphia, 1913; served during World War I; formerly on the staffs of the Veterans Administration facilities in Fort Bayard, N. M., Los Angeles and Huntington, W. Va.; on the staff of the Veterans Administration Facility in Wood, where he died September 7, aged 54, of coronary occlusion.

Edward Saunders Babcock Jr. * Sacramento, Calif.; University of California Medical School, San Francisco, 1923; specialist certified by the American Board of Pediatrics, Inc.; member of the American Academy of Pediatrics; past president of the Sacramento Society for Medical Improvement; served during World War I; for many years physician for the Sacramento Orphanage; died in the Sutter Hospital September 3, aged 47, of chronic nephritis.

Ralph Edward Barnes, Greendale, Wis.; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1908; member of the American Medical Association and the State Medical Association of Texas; formerly an executive of the Florida Public Health Association; past president of the Southern Tuberculosis Association and the Maryland Tuberculosis Association; had been affiliated with the Galveston County Health Unit in Texas; served during World War I; died August 21, aged 61, of carcinoma of the colon.

Bret Vernon Bates, Browns Valley, Minn.; University of Nebraska College of Medicine, Omaha, 1908; Drake University College of Medicine, Des Moines, 1909; member of the American Medical Association; awarded the Distinguished Service Cross for bravery during World War I; died in the Veterans Administration Facility, Minneapolis, August 6, aged 62.

William J. Beery, Detroit; Michigan College of Medicine and Surgery, Detroit, 1904; for many years on the staff of St. Joseph Mercy Hospital; died September 4, aged 69, of terminal pneumonia due to hypertensive cardiovascular disease.

James Cicero Bramblett, Chickasha, Okla.; Atlanta School of Medicine, 1908; died August 2, aged 67, of cerebral hemorrhage.

Victor Vernon Cameron, Marion, Ind.; Baltimore Medical College, 1899; died September 3, aged 69.

Clarence M. Cheadle, Burnsville, N. C.; Keokuk (Iowa) Medical College, 1898; served during World War I; died September 3, aged 76, of heart disease.

Hugh Tucker Chelf Jr., Culpeper, Va.; University of Virginia Department of Medicine, Charlottesville, 1935; interned at the Mercy Hospital in Cedar Rapids, Iowa; died September 10, aged 37, of coronary occlusion.

James Richard Condon, Spokane, Wash.; Creighton University School of Medicine, Omaha, 1923; member of the American Medical Association; team physician on the athletic staff at Gonzaga University; affiliated with the Sacred Heart Hospital; died September 8, aged 48, of coronary thrombosis.

John Francis Connole, Wilkes-Barre, Pa.; Jefferson Medical College of Philadelphia, 1906; member of the American Medical Association; died in the Mercy Hospital August 29, aged 62, of cirrhosis of the liver.

Fletcher Lovell Crocker * Pontiac, Ill.; Miami Medical College, Cincinnati, 1891; on the staff of St. James Hospital, where he died August 31, aged 79, of coronary thrombosis.

Edward Anthony Dignam * Rockville, Conn.; Medical College of Virginia, Richmond, 1928; interned at St. Francis Hospital in Hartford, where he was a member of the staff; served a residency at the New York Eye and Ear Infirmary and the Manhattan Eye, Ear and Throat Hospital in New York; on the staff of the Rockville City Hospital; died in Niantic August 26, aged 48, of coronary thrombosis.

Ralph Giddings Dryer, Tucson, Ariz.; University of Tennessee College of Medicine, Memphis, 1931; associated with Thomas-Davis Clinic; district physician and surgeon for the Southern Pacific Railroad; died August 30, aged 39, of coronary disease.

Thomas Eugene Dunnam, Houston, Texas; University of Texas School of Medicine, Galveston, 1912; member of the American Medical Association; served during World War I; died in the Memorial Hospital August 29, aged 60, of myocardial failure.

William Turner Eikner, Denver; Milwaukee Medical College, 1901; died August 24, aged 83, of coronary occlusion.

Irving A. Elson, Canton, Ohio; Western Reserve University Medical Department, Cleveland, 1891; member of the American Medical Association; died August 24, aged 81.

Walter J. Fahrner * Joliet, Ill.; Northwestern University Medical School, Chicago, 1905; on the staff of St. Joseph's Hospital, where he died September 4, aged 63, of incarcerated and strangulated direct inguinal hernia and cystic degeneration of the kidneys.

Andrew Suydam Fritts, Binghamton, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1897; past president of the Broome County Medical Society; on the staff of the Binghamton City Hospital; died August 8, aged 72, of arteriosclerotic heart disease.

Elias Gamrin, Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1915; member of the American Medical Association; interned at the Montefiore Home and Hospital and the Beth Israel Hospital in New York; on the staff of the Jewish Hospital, where he died September 7, aged 55, of coronary thrombosis.

Leroy Thomas Geer, Syracuse, N. Y.; University of Pennsylvania Department of Medicine, Philadelphia, 1901; one of the founders and served on the staff of the Onondaga General Hospital; died September 1, aged 66, of coronary thrombosis.

Zina Leslie Gilding, Vicksburg, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1910; served on the board of education and as village health officer; formerly on the staffs of the Borgess and Bronson hospitals in Kalamazoo and the Franklin Memorial Hospital; died in Schoolcraft September 5, aged 73, of cerebral hemorrhage.

William Arvel Gott, Peoria, Ill.; Chicago Homeopathic Medical College, 1901; member of the American Medical Association; served in the medical corps of the U. S. Army during World War I; died September 18, aged 70, of coronary occlusion.

George Henry Greenwood, Fredericktown, Mo.; Beaumont Hospital Medical College, St. Louis, 1897; past president of the Madison County Medical Society; died in a hospital at Farmington August 29, aged 83, of cerebral hemorrhage.

Milton Jacob Haas & Allentown, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1907; member of the staffs of the Sacred Heart Hospital and the Allentown Hospital, where he died August 26, aged 71, of coronary artery disease.

Walter George Hallstead, Penn Yan, N. Y.; Cornell University Medical College, New York, 1911; served during World War I; health officer; on the staff of the Soldiers and Sailors Memorial Hospital, where he died September 19, aged 58, of cerebral hemorrhage.

Sandy Byars Harrell, Macon, Ga.; University of Nashville (Tenn.) Medical Department, 1888; died August 24, aged 77, of chronic myocarditis.

Daniel D. Hendrickson, Middletown, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1880; past president of the Monmouth County Medical Society; served as school physician and insurance examiner; died August 17, aged 88, of carcinoma of the prostate, acute nephritis and endocarditis.

Harrison Sidney Hickok & Kansas City, Mo.; Omaha Medical College, 1895; an Affiliate Fellow of the American Medical Association; on the staff of the Trinity Lutheran Hospital; died in St. Mary's Hospital, Rochester, Minn., August 24, aged 76, of hemorrhage due to gastric ulcer.

Agnew Hodge Hilsman & Albany, Ga.; Cornell University Medical College, New York, 1899; past president of the Chattahoochee Valley Medical and Surgical Association; member of the Southeastern Surgical Association; fellow of the American College of Surgeons; surgeon to the Phoebe Putney Memorial Hospital; died August 21, aged 69, of pulmonary emphysema.

Harry Wagner Howland, Gaines, Pa.; Baltimore Medical College, 1903; member of the American Medical Association; formerly medical director of Tioga County; for many years a member of the school board; served as surgeon for the Baltimore and Ohio Railroad; died August 2, aged 63, of coronary thrombosis.

Horace Gordon Huey & Homerville, Ga.; Chicago College of Medicine and Surgery, 1915; served as chairman and member of the state board of medical examiners; formerly member of the county and local board of education; vice president of the Empire Banking Company; owner of a hospital bearing his name; died August 25, aged 54, of heart disease.

David Bunyan Jackson, Greer, S. C.; Southern Medical College, Atlanta, 1885; member of the American Medical Association; died August 7, aged 87.

A. Judson James, Houston, Texas; University of Texas School of Medicine, Galveston, 1899; honorary member of the State Medical Association of Texas; member of the American Medical Association; died August 25, aged 84, of cerebral hemorrhage.

William Leroy Kenney, St. Joseph, Mo.; State University of Iowa College of Medicine, Iowa City, 1897; member of the American Medical Association; honorary member of the Missouri State Medical Association; formerly professor of clinical ophthalmology at the Ensworth Medical College and on the faculty of the Central Medical College; served in France during World War I; on the staff of the Missouri Methodist Hospital, where he died August 11, aged 72, of cerebral hemorrhage.

Arthur Charles Kleutgen & Chicago; Northwestern University Medical School, Chicago, 1902; formerly associate professor of medicine at Loyola University School of Medicine; on the staff of the Woodlawn Hospital, where he died September 13, aged 66, of coronary thrombosis and hypertension.

Edward Allen Knowlton & Holyoke, Mass.; Tufts College Medical School, Boston, 1909; fellow of the American College of Surgeons; chairman of the state board of registration in medicine; senior visiting surgeon, Holyoke Hospital; visiting surgeon, Providence Hospital; consulting surgeon to the Belchertown State School, Belchertown; died August 22, aged 62, of cerebral hemorrhage.

Robert Antoine LeTourneau & Chicago; Northwestern University Medical School, Chicago, 1895; an Affiliate Fellow of the American Medical Association and emeritus member of the Illinois State Medical Society; served on the city board of health and on the staffs of the Jackson Park, County and Chicago Baptist hospitals; died September 5, aged 83, of coronary thrombosis and hypertension.

Gustav Adolph Mack, Gallipolis, Ohio; Bellevue Hospital Medical College, New York, 1894; member of the American Medical Association and the Association of Military Surgeons of the United States; served during World War I; captain in the medical reserve corps of the U. S. Army, not on active duty; for several terms county coroner; surgeon for the New York Central Railroad for many years; died August 18, aged 76, of carcinoma of the pancreas.

Charles Marcellus Mashburn & Atlanta, Ga.; Atlanta College of Physicians and Surgeons, 1912; specialist certified by the American Board of Pediatrics, Inc.; formerly associate in pediatrics at the Emory University School of Medicine; served during World War I; on the staffs of the Georgia Baptist and Piedmont hospitals; died in the Blackman Sanatorium August 14, aged 55, of chronic pyelitis.

Claude William Mason & Omaha; University of Nebraska College of Medicine, Omaha, 1905; assistant professor of medicine at his alma mater; fellow of the American College of Surgeons; formerly a medical missionary in Siam and China; for many years a member of the board of education, of which he had been past president; on the staffs of the University of Nebraska Hospital, St. Catherine's Hospital and the Immanuel Deaconess Institute, where he died August 4, aged 65, of coronary infarction.

James Henry McCaffrey, Buffalo; Baltimore Medical College, 1898; died in the Sisters Hospital August 30, aged 75, of carcinoma.

Americus Ojeda McMichael, Denver; Drake University Medical Department, Des Moines, 1894; also a graduate in pharmacy; died in St. Luke's Hospital August 12, aged 81, of cerebral hemorrhage and cardiovascular renal disease.

Samuel Albert Miller & Longview, Texas; University of Tennessee Medical Department, Nashville, 1894; died August 28, aged 78, of hypertension and nephritis.

Robert Booth Moore, Little Rock, Ark.; Columbia University College of Physicians and Surgeons, New York, 1914; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; served overseas during World War I; one of the founders and on the staff of the Trinity Hospital; died in the Barnes Hospital, St. Louis, August 12, aged 57, of lymphosarcoma.

Mary Catherine Couch Mora, East Islip, N. Y.; Tufts College Medical School, Boston, 1912; served on the staff of the Central Islip State Hospital in Central Islip; died August 19, aged 55, of cerebral arteriosclerosis.

Lyman Sanderson Osborne, Fitzgerald, Ga.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1878; member of the American Medical Association; honorary member of the Medical Association of Georgia; member of the school board and served as city health officer; for many years physician for the Fitzgerald Cotton Mills; on the staff of the Fitzgerald Hospital; died August 6, aged 90, of senility.

Richard Frederic Lot Ridgway, Allentown, N. J.; Johns Hopkins University School of Medicine, Baltimore, 1906; member of the American Medical Association, American Psychiatric Association and the Medical Society of the State of Pennsylvania; past president of the Dauphin County (Pa.) Medical Society; served as chief physician at the Harrisburg (Pa.) State Hospital; died in the Hospital of the University of Pennsylvania, Philadelphia, August 15, aged 70, of bronchopneumonia and paralysis agitans.

William Roberts & Major, U. S. Army, retired, Washington, D. C.; Georgetown University School of Medicine, Washington, 1894; died April 19, 1944, aged 79, of heart disease.

Louis Hymen Roddy ⊕ Waco, Texas; University of Maryland School of Medicine, 1909; medical examiner for the Selective Service; on the staffs of the Providence Hospital and the Hillcrest Memorial Hospital, where he died August 20, aged 57, of coronary occlusion.

Jacob Rubin, Chicago; Loyola University School of Medicine, Chicago, 1921; member of the American Medical Association; died in the Presbyterian Hospital July 10, aged 55, of coronary disease and hypostatic pneumonia.

Eugene Farmer Sanford, Buchanan, Ga.; Hospital Medical College, Eclectic, Atlanta, 1910; University of Georgia Medical Department, Augusta, 1912; president of the Haralson County Medical Society; member of the American Medical Association; major in the medical corps of the U. S. Army during World War I; served as member of the governor's staff, mayor of Buchanan and member of the city council; died in the Harbin Hospital, Rome, July 26, aged 55, of arteriosclerotic heart disease.

Margaret McPhee Sanford, Boston; Boston University School of Medicine, 1898; died in Billerica August 31, aged 78, of acute myocarditis.

Harry B. Smith, Keo, Ark.; Memphis (Tenn.) Hospital Medical College, 1901; died in Little Rock August 13, aged 70, of chronic nephritis.

Dalton Harris Trepagnier, New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1903; served during World War I and with the U. S. Veterans Bureau; died July 13, aged 66, of coronary thrombosis.

Roy J. Turner, New Baltimore, Mich.; Michigan College of Medicine and Surgery, Detroit, 1906; also a minister; member of the American Medical Association; died July 10, aged 65, of cardiac decompensation.

William Bowers Watts Jr., Claremont, Calif.; University of Georgia Medical Department, Augusta, 1915; member of the American Medical Association and the Arizona State Medical Association; fellow of the American College of Surgeons; served overseas during World War I; formerly chief surgeon at the Miami-Inspiration Hospital in Miami, Ariz.; died in the San Antonio Community Hospital, Upland, July 17, aged 52.

Benjamin B. Wechsler ⊕ Pittsburgh; University of the South Medical Department, Sewanee, Tenn., 1900; died August 17, aged 66, of coronary thrombosis.

LIEUT. COL. ALBERT C. KRUKOWSKI
M. C., A. U. S., 1907-1944

MAJOR CHARLES HENRY WILSON
M. C., A. U. S., 1889-1944

LIEUT. ROBERT JOHN PETTERS
M. C., A. U. S., 1920-1945

Samuel Schaeffer ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1908; on the staffs of the French and Park West hospitals; died August 16, aged 58, of arteriosclerosis.

James W. Williams, Dallas, Texas; University of Louisville (Ky.) Medical Department, 1883; died August 19, aged 86.

Lewis Edward Zins, New York; Illinois Medical College, Chicago, 1898; died July 20, aged 71.

KILLED IN ACTION

Albert Charles Krukowski ⊕ Lieutenant Colonel, M. C., U. S. Army, San Antonio, Texas; McGill University Faculty of Medicine, Montreal, Que., Canada, 1935; interned at the Station Hospital in Fort Sam Houston, San Antonio; U. S. Army Medical School in 1937; entered the medical corps of the U. S. Army on July 1, 1936; promoted to captain on July 1, 1939; after a tour of duty at Station Hospital, Fort Bragg, N. C., served at Corregidor, P. I.; en route from the Philippines in December of 1941 when the Japs attacked the Islands and Pearl Harbor; his ship made port safely in Honolulu on Dec. 17, 1941 whereupon he was immediately assigned to emergency temporary duty at one of the provisional general hospitals there; returned to the United States on June 1, 1942; promoted to major on July 7, 1942; served as executive officer of Percy Jones General Hospital at Battle Creek, Mich., until Oct. 6, 1943, when he was transferred to Camp Swift, Texas, taking command of the 110th Evacuation Hospital; promoted to lieutenant colonel on June 2, 1943; after an intensive training period the unit

went overseas, where it supported the Third U. S. Army in severe combat; died near Bastogne, Belgium, Nov. 7, 1944, aged 37.

Charles Henry Wilson, New York; Tufts College Medical School, Boston, 1913; served eighteen months overseas during World War I and was discharged as a captain; began active duty as a major in the medical corps, Army of the United States, on March 10, 1941; sent to Manila, where he was stationed at the Sternberg General Hospital; after the fall of the Philippines, went through the ordeal of Bataan and Corregidor and became a war prisoner; killed during an air attack in the Pacific area Dec. 15, 1944, aged 55, while being transported aboard a Japanese vessel from the Philippine Islands to Japan.

Robert John Petters, Kenmore, N. Y.; University of Minnesota Medical School, Minneapolis, 1944; interned at the Buffalo General Hospital in Buffalo; began active duty as a first lieutenant in the medical corps, Army of the United States, on Oct. 6, 1944; killed in action in Okinawa, April 19, aged 25.

Correspondence

THE GERMAN UNIVERSITY MEDICAL SCHOOLS DURING THE OCCUPATION

To the Editor:—At the invitation of Major Gen. Morrison C. Stayer, chief of the Public Health and Welfare Division of the U. S. Group Control Council (Germany), I visited during August and September all of the universities in the United States zone of occupation and the majority of those in the other three zones with Major H. M. Rozendaal, Capt. J. S. Lichty and Dr. E. Y. Hartshorne, who are assisting General Stayer in the resumption of German medical education. Their excellent observations as well as the results of several visits to Germany are incorporated in this report.

The German medical schools, which were good in 1912, have not kept pace with the advances in medicine. Except for an occasional specialist who has become famous, the German graduates, even those who took postgraduate work as assistants, are not equal to the average American senior medical student. The reasons are lectures without adequate laboratory and clinical work, too many students with little or no selection, inadequate facilities and faculties which are too small, the members of which do not know modern non-German medicine, whose salaries depend on the number of their students so that they are tempted to encourage an increased enrolment, who also examine their own students and thus may lower standards, and who have too much private practice. Furthermore, the separation of research workers from the medical schools into Kaiser Wilhelm institutes has reduced the productiveness of German medicine so that the medical journals for a generation have been of little scientific value. Unfortunately, most of the Germans do not realize that improvement, reorganization, limitation and supervision of medical education are necessary. As a result, although accurate figures are not available, German physicians, in addition to being poorly trained, are too numerous. The early opening of the medical schools is unnecessary to supply more physicians, but it is desirable in order to maintain continuity of medical education. The German medical schools should be a warning to us not to let our pride in American medical education reach the point at which we are completely satisfied and are unwilling to try to improve it.

Of the seven schools in the United States zone only three have intact physical facilities (Marburg, Heidelberg and Erlangen), but the other four (Giessen, Frankfurt, Munich and Würzburg) have improvised usable accommodations for the hospital care of patients in their communities; their facilities for teaching, however, are inadequate.

The three following programs for the opening of the medical schools have been suggested:

1. Limited denazification without reform: Reopening as they now stand with denazification limited to the removal from the faculties of only those individuals arrested under the orders of the military government or removed by action of the present faculty or its planning committees. This is the plan desired by the Germans themselves. It would permit some individuals, who would ordinarily be removed under existing directives, to continue in their present positions, but it is contrary to the aims of the military government.

2. Complete denazification and reform with active American participation: Complete denazification of the university; rigid selection of students; reorganization of the curriculum to introduce laboratory and bedside teaching in place of the present lecture system; establishment of a uniform, short, practical, final examination to replace the time-consuming *staatsexamen*; the payment of adequate teaching salaries with the university retaining all student fees; provision of supplements to German libraries and laboratories from American sources, and sponsor-

ship of each opened German medical school in the United States zone by some American medical school, which probably, if invited, would rotate some of its faculty members to the German school so that modern teaching methods could be established and maintained. Although the installation and continuance of this program would benefit both the German and American medical schools, it is not practical because of the uncertainty of essential German cooperation and the possible adverse reaction from American and Allied sources.

3. Complete denazification without reform: The denazification of the medical faculties without reorganization of the curriculum, except for the elimination of Nazi ideology and of dangerous research activities.

The third program is the most practical one and is in accord with the aims of the military government, making the Germans work out their own problems after having been completely denazified. Complete denazification automatically removes over 50 per cent of the members of faculties and staffs from the schools, and the result raises the serious problems of adequate personnel and the maintenance of the standards of medical education. Traditionally, the size of the faculty of medicine of each university has been small, numbering from fifty to sixty individuals, some of whom are only nominal. The clinic assistants, who are in addition to the faculty, have no part in the instruction of students even though they are full time employees of the university. Denazification will leave each medical school with several departments in which no individual of the former faculty remains, and the majority of the assistants also are slated for removal from their present positions. Heidelberg and Marburg have been able to conduct postgraduate courses with a denazified teaching staff because a complete curriculum is not required. However, politically acceptable replacements probably can be obtained from the United States zone so that Heidelberg, Marburg and Erlangen should be able to open on November 1 with regular medical semesters.

Major Gen. Morrison C. Stayer, Brig. Gen. James Stevens Simmons and Col. Thomas B. Turner made this survey possible.

CHEMICAL COMPOUNDS WITH INHIBITORY EFFECT IN HYPERTHYROIDISM

To the Editor:—Occasionally, discoveries are made in apparently unrelated fields in medicine which under closer examinations can be brought under a common denominator.

While a chief resident at the Montefiore hospital, New York, I was investigating a possible influence of thiouracil on cancer of the thyroid gland. The results, however, were inconclusive. But while examining goitrogenic substances it occurred to me that potassium thiocyanate, known to produce goiter, has a chemical formula similar to thiourea. By substituting the K— by NH₂—, ammonium thiocyanate, NH₄CNS, is obtained. This chemical compound can be converted into thiourea:

This formula evidently explains the goitrogenic property of potassium thiocyanate.

Other goitrogenic substances include the sulfonamides. It is assumed, almost with certainty, that the bacteriostatic effect of the sulfonamides is due to a substitution of metabolites essential to the growth of the bacteria by substances which differ only slightly. The latter will be taken up by the bacterial organism, but it cannot be metabolized any further, thus bringing bacterial growth to a standstill. Because of their chemical similarity the sulfonamides compete with para-aminobenzoic acid, an essential metabolite (Woods, D. D.: *Brit. J.*

Exper. Path. 21:74 [April] 1940. McIlwain, Henry, and Hawking, Frank: *Lancet* 1:449 [April 10] 1943). A similar process may take place when thiourea is offered to the thyroid gland. Somewhere in the synthesis of thyroxin thiourea substitutes an essential metabolite similar to thiourea in its construction. This unnatural metabolite will be synthesized into a biologic artefact devoid of hormonal function. Therefore the symptoms due to thyroxin will disappear. Unfortunately both thiourea and thiouracil have toxic side effects such as agranulocytosis. The presence of an artificial metabolite in the production of the white blood corpuscles may be the causative factor behind this complication. In my unpublished paper, which was sent to the Lederle Company, Pearl River, N. Y., I suggested that other substances could be used to suppress the activity of an overfunctioning thyroid gland. Compounds of thiourea with side branches similar to sulfathiazole or sulfadiazine or compounds able to replace other metabolites essential to the synthesis are an example.

It may be just speculation, but potassium thiocyanate may block the utilization of an essential metabolite in the synthesis of a vasopressor substance. Here too derivatives of thiocyanates may enhance the vasodepressing effect. Since I am in the Army, investigations along this line are impossible for me to carry out. Therefore I make these suggestions to stimulate further experiments in this field.

A. D. JONAS, Lieutenant, M. C., A. U. S.

TREATMENT OF THE AGONAL STATE AND OF CLINICAL DEATH

To the Editor:—Study of the physiology and therapy of the agonal state in animal experiments and of these problems in man led me to the conclusion that arteriovenous transfusion of blood with epinephrine and glucose added to it, combined with vigorous artificial respiration, are the most important factors in the process of resuscitation. Today we may consider it established that death of the organism does not always take place as a sudden cessation of life. Biologic or irrevocable death is usually preceded by what is termed clinical death diagnosed because of cessation of cardiac and respiratory activity. During this period of clinical death, which does not last more than five or six minutes, the tissues and organs have not had sufficient time to undergo irreversible changes. Clinical death, therefore, is merely a qualitative expression of the process of dying. In a number of cases the transition from life to death can be arrested during this period. Whatever the cause of the agonal state or of clinical death, waning of respiratory function and of circulation of the blood are the major morbid processes which, if allowed to continue, will lead to the death of the organism. The process of dying taking place in the agonal state or in the state of clinical death can be arrested and death averted by reversing these two cardinal functions. I felt that data which I had obtained in animal experiments were applicable to the treatment of wounded soldiers dying from their injuries. Accordingly, I went to the front to work in the field dressing stations.

The major efforts in the method were aimed at the restoration of the cardiovascular function by means of arteriovenous transfusion and of vigorous artificial respiration by means of a bellows. To the blood, which was heated up to 37 C., was added 1 to 2 cc. of 4:1,000 solution of epinephrine hydrochloride and 50 to 100 cc. of 40 per cent solution of glucose. The needle was introduced into the brachial artery and the blood was infused in the centripetal direction, i. e. toward the heart, under a pressure of 180 to 200 mm. of mercury. As soon as a strong contraction of the heart was obtained, blood was infused by way of the brachial vein under pressure of 40 to 60 mm. of mercury. Usually transfusion of 200 to 300 cc. of blood into the artery sufficed to produce the necessary effect,

i. e. restoration of the coronary circulation. The amount of blood introduced into the vein depended on the condition of the patient and varied from 500 to 1,200 cc. Artificial respiration was carried out with the aid of a bellows of the capacity of 0.5 to 2 liters. In the beginning artificial respiration was continued at a rate of 25 to 30 respirations per minute, and later it was reduced to 16 to 20 per minute. The amount of air introduced with each respiration was shown on the scale of the bellows as 1,000 to 1,500 cc. Artificial respiration was continued for some time after the appearance of normal breathing, although the rate was reduced and it was applied with intervals of rest.

The major indication for this therapy is primarily sudden death from such causes as excessive loss of blood, suffocation, agonal state and clinical death in patients suffering from severe injuries to limbs, collapse and the like. I treated, in the course of four months, 51 cases of shock, agonal and preagonal states and clinical death. There were 17 cases of severe shock, 20 cases of agonal state, 10 cases of clinical death and 4 cases of suffocation. In 34 of the 51 cases the treatment preceded proposed surgical intervention, and 31 of these patients were able to undergo such treatment.

The final results are as follows: In 12 of the 51 cases, treatment resulted in permanent effects in men who were regarded as hopeless and who were already in the agonal state or in the state of clinical death. They were evacuated after resuscitation to base hospitals. In 37 other cases the effect was not permanent and the wounded men died later as a result of the grave nature of their injuries. Among patients treated in the state of clinical death, 5 have recovered completely all of their functions—the dead were brought back to life. With 1 exception I did not find any disturbance of the central nervous system in the resuscitated men.

In view of these results, I consider it the task of the doctor to give active treatment to patients in the agonal state and in the state of clinical death. One should not abandon one's efforts at resuscitation even after the cessation of cardiac and respiratory action, especially in cases of sudden death. From this moment on the struggle is difficult but is not hopeless. A heart that has stopped beating can be made to resume its action in a number of cases. Respiration may also be restored, although this is even more difficult. Restoration of the functions of the whole organism follows.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Extragenital Choriocarcinoma in Male.—Laipply and Shipley state that if strict criteria are maintained and if negative serial block sections of the testes are considered essential, only 7 cases of extragenital choriocarcinoma in the male recorded in the literature furnish conclusive proof of an extragenital origin. To these Laipply and Shipley add their own case, making a total of 8 unquestionably proved cases of primary extragenital choriocarcinoma in the male. They report that a complex teratoma originating in the thorax of a boy aged 13 years was removed surgically. He died seven years later of either a recurrence or an independent teratoma with choriocarcinoma in the tumor and widespread choriocarcinomatous metastases. Gynecomastia, testicular atrophy and hyperplasia of the interstitial cells of Leydig were associated with the tumor. Endocrine alterations resembled those of pregnancy.

Hemiplegia Following Ether Anesthesia. J. E. Pischke.—p. 522.

Immediate Effect of Morphine on Respiration.—Dripps and Comroe administered morphine sulfate intravenously to 26 persons (3 female, 23 male) whose ages ranged from 19 to 88 years and whose weights ranged from 42.2 to 87.4 Kg. Six persons over the age of 70 received 10 mg. ($\frac{1}{4}$ grain); the others received 15 mg. ($\frac{1}{4}$ grain). Twenty-three persons

(7 female and 16 male) received morphine intramuscularly; their ages varied from 20 to 88 years and their weights from 47.7 to 99.5 Kg. Eleven of these were given 20 mg. ($\frac{1}{2}$ grain), 2 received 15 mg. ($\frac{1}{4}$ grain), 1 received 12 mg. ($\frac{1}{2}$ grain) and 9 received 10 mg. ($\frac{1}{6}$ grain). Intravenous injection of morphine produced maximal depressant effects within three to seven minutes in the majority of instances. Respiratory minute volume, rate and tidal exchange were diminished. The maximal respiratory depression following morphine is approximately the same whether the morphine is administered intravenously or intramuscularly. Morphine given intravenously appears to be safer because the full degree of respiratory depression becomes apparent within three to seven minutes. Following intramuscular or subcutaneous injection of morphine, the depression may gradually deepen over a period of thirty to ninety or more minutes. If the patient given intravenous morphine is watched carefully over a ten minute period after injection, the maximal depression will usually be noted. When morphine is injected intravenously as preoperative medication before general anesthesia, induction of general anesthesia should be delayed ten minutes after the injection until the maximal depression has been noted. If this precaution is observed, the intravenous route is a useful one prior to general anesthesia, since it enables the anesthetist to avoid the annoying combination of increasing respiratory depression from morphine and the anesthetic agent.

Liver and Kidney in Anesthesia Produced by Barbiturates.—Masson and Bland used partially hepatectomized or completely nephrectomized animals to determine the relationship between the duration of action of barbiturates and the site of their detoxification. Twenty-nine compounds were investigated in experiments on rats. For each compound the degree of detoxification (inactivation or elimination) in the liver or the kidney was represented by an "index of detoxification," or the ratio of the average duration of anesthesia of control animals to the average duration of anesthesia of experimental animals. The authors suggest that the barbiturates be classified in four groups according to the site of their detoxification. They include in group 1 those detoxified mainly in the kidney: barbital and phenobarbital. Group 2 includes those detoxified mainly in the liver: ipral, amytal, pentobarbital sodium, oralal, alurate, nostal, seconal, allyl pental, evipal, thioethamyl. Those detoxified approximately equally in the liver and kidney—neonal, delval, phanodorn and dial—are placed in group 3. Group 4 includes those possibly detoxified in all the tissues of the body but not to any great extent in the liver or kidney; that is, pentothal, propyl 1-methylallyl and allyl 1-methylallyl thiobarbiturates.

Vincent's Disease of Skin.—A man aged 23 complained that his feet had been painful for the past two months. Walking was difficult, and the feet stung whenever anything touched them. There was a pronounced fetid odor from the feet, swelling of the paronychia tissue, purulent discharge and loosening of nails from the nail bed. On the left foot between the second and third interspaces there was an ulcer. The remaining interspaces showed crusting and desquamation. The lips were dry and showed slight fissuring. There was an ulceration at the commissures. The gums were swollen, painful and reddened; the tongue presented fissuring, with areas of denudation. The tonsillar and the pharyngeal mucosa were reddened and con-

gested. Examination revealed a large number of Vincent's spirilla and fusiform spirilla in the gums and a moderate number of the Vincent symbiotic organisms in the tonsillar and pharyngeal areas. In smears from the ulceration at the commissures of the mouth and in the lesion of the interspaces of the toes (ulcer) a moderate number of Vincent's spirilla and fusiform bacilli were found. The local treatment as described by Strickler consisted in application of sodium perborate to the feet and 10 per cent neosarsphenamine in glycerin to the gums. The patient remained in the hospital for thirty-six days and was discharged with the feet free from lesions.

Diphtheria Among Schick Negative Persons.—Gibbons reviews 1,028 cases of diphtheria admitted to the Infectious Diseases Hospital in Halifax, Nova Scotia. There were 44 deaths. Death occurred in a child who had shown a primary Schick negative test two years and five months previously and in another child who had received three doses of fluid toxoid six months previously. Twenty-one per cent of the cases of diphtheria occurred in persons who had shown a primary negative Schick test or who had had three doses of toxoid within the previous three years. When the incidence rates in two groups, Schick negative (natural or induced by toxoid) and others, are calculated, it is found that the rate in the Schick negative group is approximately one tenth of the rate in the unprotected population.

Infection in Penetrating Wounds of Head.—Rowe and Turner present observations on a large series of battle casualties seen in a neurosurgical center. Approximately 15 per cent of the head wounds showed infection. In most instances of infection the wound must be widely reopened to prevent the development of pockets of pus and extension of the infection to deeper structures. Penicillin has been effectively employed locally in solution (10,000 units per cubic centimeter of isotonic solution of sodium chloride) through a Dakin tube laid in the wound and carried out through the dressing. This method permits the frequent instillation of the drug (usually 10,000 units every three hours). It has the further advantages of permitting aspiration of pus from the wound before each instillation. The tube should not remain in place for more than one week. Dry penicillin mixed with sulfanilamide crystals (5 to 10,000 units of penicillin to each gram of sulfanilamide) has been dusted into the wound as an alternative method of local application. Meningitis is one of the most serious complications of penetrating wounds of the head. It has occurred in this series in approximately 4.5 per cent of the cases. The clinical picture produced by early meningitis following a penetrating wound of the head is not always clearcut. Sometimes there is relatively little febrile reaction and the patient may not appear acutely ill. It is of primary importance to eliminate the source of the infection. Wide opening of an infected wound, removal of a necrotic cerebral fungus and repair of a cerebrospinal fluid leak constitute active therapy directed at the seat of the infection. Second in importance is the maintenance of adequate chemotherapy. The effectiveness of the treatment of meningitis depends to a great extent on the causative organism. If it is penicillin resistant the prognosis becomes much worse. Mixed infections that included organisms of the colon group produced the most dangerous meningeal infections. A striking percentage of brain abscesses have been clinically silent, many reaching considerable size with little evidence of increased intracranial pressure. Complete evacuation of the abscess in combination with local and systemic chemotherapy has proved effective in most cases.

Tantalum in Nerve Suture.—White and Hamlin point out that tantalum has the advantages of easy processing into plates, thin sheets or wire at the factory and of convenient sterilization, drilling, shaping or cutting in the operating room. It is ideal for nerve suture, as it can be drawn to extreme thinness (0.003 inch), ties with ease and can also be subsequently visualized in the x-ray as a marker of the position of the divided nerve ends. In sheets 0.001 inch thick it can be cut and rolled to fit the end of a nerve stump from which a painful neuroma has been removed. By crushing the distal open end a snugly fitting cap is formed which effectively prevents reformation of the neuroma. The same procedure is recommended for sealing off the cephalic stump of the divided thoracic ganglionated chain in preganglionic sympathetic denervation of the upper extremity. Annealed rolls of sheet tantalum (0.00075 inch) constitute a distinct improvement over the former use of foil in the protection of nerve anastomoses. Unlike the finer foil, these sheets show no tendency to crumple, and their use is of value under special circumstances which are often encountered in wartime injuries.

Sodium Fluoride and Dental Caries.—Knutson and Armstrong present data on the incidence of dental caries in the permanent teeth of a treated group of children and a control group of children for the second year of a longitudinal study. The ages of the children at the time the study was begun varied from 7 to 15 years. The treated group, originally consisting of 337 children, received topical fluoride applications to the teeth in the left quadrants of the mouth. The teeth in the right or untreated mouth quadrants served as direct controls. An additional group of children, originally consisting of 392 children enrolled in the same schools as the treated children, did not receive fluoride treatments and served as additional controls. During an eight week period each child in the study groups received dental prophylaxis and a detailed dental examination. In addition the children in the treated group received from seven to fifteen topical applications of fluoride to the teeth in the left quadrants of the mouth. The fluoride treatment procedure consisted in isolation of the teeth with cotton rolls, drying the teeth with compressed air and wetting the crown surfaces of the teeth with 2 per cent sodium fluoride solution. The applied solution was allowed to dry in air for approximately four minutes. Analysis of the results for the two year period ended in May 1944 indicates that during both these time periods the initial caries attack on fluoride treated teeth continued to be approximately 40 per cent less than on untreated teeth. Furthermore, not only did the number of additional tooth surfaces attacked in previously decayed teeth continue to be less in treated than in untreated carious teeth, but the magnitude of the difference was appreciably increased during the second year.

Arachnodactyly.—During the past year Parker and Hare have seen 4 patients with arachnodactyly. Three were members of the same family, a father and 2 daughters. The diagnosis of arachnodactyly can be established by a survey of the patient provided the physician is conscious of the essential features of this syndrome. The patient is tall and appears awkward, with excessively long arms and legs, long, thin, spider-like hands, meager subcutaneous fat, underdeveloped atonic musculature and often ectopia lentis. The emaciation accentuates the bony landmarks, and these in turn serve to emphasize the disproportionate length of the extremities as compared to the trunk. The delicately elongated, spider-like fingers give this syndrome its name. The feet and toes are likewise long and

slender. Deformities of the joints are common. Pes planus, contractures, hammer toes, webbing and sometimes abnormally mobile patellas occur. The frequently associated scoliosis, kyphosis, winged scapula and deformities of the sternum are considered to be the result of the laxity of the ligaments and atonic musculature. The skull of the arachnodactylic patient tends to be dolichocephalic with prominent supraorbital ridges, frontal bossing, a pointed chin and either a prominent or a broad, somewhat flattened nose. The face is usually drawn, wrinkled and old looking, often with a melancholy expression. The ears are frequently enlarged. Approximately 50 per cent of the patients have a partial dislocation of the lens, usually upward. Congenital heart anomalies frequently accompany the disease and consist mainly of a patent foramen ovale and other interauricular septal defects. In the infant or rapidly growing child, especially without eye abnormalities, this syndrome may be mistaken for rickets. The abnormally long and slender extremities, the absence of flared epiphyses, normal blood calcium and phosphorus, and perhaps obscure anomalies in the parents, should lead one to suspect arachnodactyly. The symptoms of weakness, fatigue, moderate dyspnea on exertion, malnutrition and a coarse systolic murmur in early childhood may focus attention on the cardiovascular system to the exclusion of what appear to be lesser anomalies. The erroneous diagnosis of rheumatic heart disease with malnutrition and rachitic stigmata may be made.

Roentgen Therapy of Neoplasms of Brain.—Peirce and his associates treated primary neoplasms of the brain stem with radiation. For a time a conservative program was followed. This consisted in several series of 3,000 to 6,000 roentgens (in air) divided among several ports at three month intervals until the desired total was reached. So little constitutional reaction was encountered that the authors now commonly administer total doses of 10,000 to 15,000 roentgens (in air) at 50 cm. focus skin distance with the Thoraeus filter, the half value layer being 2 mm. of copper. Filtration of 1 mm. of copper and 1 mm. of aluminum has been used occasionally. Definite clinical improvement was effected by roentgen therapy of primary malignant neoplasms of the brain and brain stem. Twenty-five of 60 patients with complete follow-up over the past four years are either alive and well or alive and well save for residual symptoms. No deleterious effects due to the roentgen therapy have been observed in the series. Primary regrowth of hair has been excellent. No late degenerative changes have been observed following total tumor doses of 15,000 roentgens. Glioblastoma multiforme continues to show a high mortality rate despite increasingly large doses of roentgen radiation. Tumor doses in excess of 7,500 roentgens will be required. The effect on astrocytoma is not as great as would be expected, but this should not discourage treatment similar to that recommended for glioblastoma.

Thrombophlebitis of Cubital Veins in Blood Donors.—In approximately 285,000 venipunctures performed at the Blood Donor Center at Chicago, thrombophlebitis in the cubital veins following venesection occurred in 12 instances. The predisposing factors to this complication appear to be trauma to the vein wall, slowing of the blood flow by application of a circular bandage, hematoma, systemic reaction, acute flexion of the forearm and straining of the arm during exercise following the venipuncture. Eleven cases occurred in females and 1 case in a male. The best preventive measures appear to be careful venipuncture technique, immediate discontinuance of the bleeding if hematoma develops or the donor complains of the needle causing discomfort and preventing the donor from flexing acutely his forearm after venipuncture. A circular bandage should not be applied as a dressing. Disability following this complication averaged approximately four months.

Pressor Activity in Urine.—Euler and Sjöstrand prepared ether extracts of urine from 37 patients with hypertension, from 59 patients with various diseases but with normal blood pressure, and from normal persons who were known to be non-smokers. The pressor activity of these urine extracts was tested on the blood pressure of cats. The presence of pressor substances in the urine from healthy persons was confirmed. The pressor activity of urine from patients with various diseases but with normal blood pressure did not differ significantly from that of normal persons. There was a statistically lower content of pressor activity in the urine from patients with hypertension. In 3 cases of chronic nephritis the amount of pressor substances was so low that it could not be determined. It may be considered as established that urine from hypertensive patients does not contain more pressor activity than urine from persons with normal blood pressure but actually may contain less. The pressor activity of urine was given in terms of isomylamine hydrochloride, which has generally been assumed to account for the pressor action of urine. Experiments carried out by the authors suggest that this substance may not be wholly responsible for the effect. In a few cases the action of isomylamine was diminished or even suppressed by cocaine, but in most cases the effect was unchanged.

Primary Acquired Hemolytic Jaundice.—The Kirkegaards consider primary acquired hemolytic jaundice as a hemolytic anemia associated with jaundice without a hereditary factor and without any other underlying disorder. Sixty-nine cases with a negative family history have been collected from the literature; in 11 of these cases the examination of the blood of the families gave negative results. In these patients no other fundamental disorder such as infection, intoxication and disease of the blood was found to suggest that the acquired hemolytic jaundice is secondary to or symptomatic of such a disorder.

In the authors' case of acquired hemolytic jaundice, as well as in 69 cases in the literature, it has not been possible to demonstrate any underlying disorder. Although it is not possible to give a valid proof of the occurrence of a primary acquired hemolytic jaundice, the authors believe that it is justifiable to consider the acquired form as an independent disorder.

Hyperventilation Studies.—Christensen made oscillometric determination on 6 normal persons under different types of ventilation. The experiments showed that ventilation favoring release of carbon dioxide from the blood brings about a constriction of the large arteries of the extremities. The change in the shape of the oscillometric curve occurred in all cases long before the appearance of subjective symptoms of apnea. In none of the experiments was apnea observed after the hyperventilation, though in some of the cases there appeared symptoms of apnea during the hyperventilation. Hyperventilation experiments were carried out on the same persons and in the same manner as the hyperventilation experiments. In none of the experiments did there occur any flattening of the oscillometric curve. A slight, involuntary hyperventilation was revealed in a few cases. Additional oscillometric measurements were made on 3 persons with severe anemia resulting in hyperpnea. These patients presented a distinctly flattened oscillometric curve associated with normal arterial pressure. Gradually, as the anemia and the hyperpnea subsided, the oscillometric curve became normal. The author believes that the state of contraction of the arteries is a fine indicator of carbon dioxide tension of the arterial blood.

Felt's Syndrome.—Zimmer reports the occurrence of Felt's syndrome in a woman aged 30. A sister of the patient presented a similar clinical syndrome. In her immediate family there were several persons with rheumatic fever. The patient presented the typical triad of chronic polyarthrititis, leukopenia with granulocytopenia and enlarged spleen. The arthritis began three and a half years earlier in association with a nonspecific inflammation of the jaw. Sulfanilamide had been administered. The hyperplastic bone marrow showed arrested maturation of the granulocytes after the metamyelocyte phase. There was no generalized hypertrophy of the lymph nodes. Considerable loss of weight had occurred in recent years. Treatment with extract of liver, iron in large doses, a course of arsenic, local application of roentgen rays to the splenic region and blood transfusion proved ineffective. The effect of splenectomy was striking. The patient's temperature became normal on the second day after the operation. Leukocytosis and thrombocytosis developed. Arrest of maturation was immediately relieved. The patient regained her normal weight and returned to work on a farm. Granulocytopenia in predisposed persons with polyarthrititis may present the clinical picture of Felt's syndrome. The disposition depends on an endogenous constitutional factor, which is suggested by the occurrence of Felt's syndrome in one of the sisters of the patient. Even if a direct morbid condition of the bone marrow cannot be excluded, a malfunction of the spleen may be a factor of great importance in the changes in the leukopoiesis (granulocytopenia) and the occurrence of the actual syndrome. This concept is supported by the complete recovery which took place after splenectomy.

Book Notices

Virus as Organism: Evolutionary and Ecological Aspects of Some Human Virus Diseases. By Frank MacFarlane Burnet, M.D., F.R.S., Director, Walter and Eliza Hall Institute of Research in Pathology and Medicine, Melbourne, Australia. Harvard University, the Edward K. Dunham Lectures for the Promotion of the Medical Sciences, 1944. Harvard University Monographs in Medicine and Public Health [Number 8]. Cloth. Price, \$2. Pp. 134. Cambridge, Mass.: Harvard University Press; London: Oxford University Press, 1945.

This compact little book, which can easily be carried about in one's pocket, is full of provocative and digestible thoughts about the more important virus diseases of man. These thoughts were presented in the Edward K. Dunham Lectures given at Harvard University in 1944 by Dr. Burnet of Melbourne, Australia. He hails a long way from Cambridge, Mass., or for that matter from any part of America, but is no stranger to American students of virus disease or to others who have followed his work and perhaps read his previous book, published in 1940, on "The Biological Aspects of Infectious Disease." In the previous book, as in this one, Dr. Burnet goes to some pains to point out that the study of infectious disease in general, and virus disease in particular, is such an important aspect of human life that it is worth while trying to understand how it falls into the general scheme of things. He believes that there is plenty of room for further coordination with other biologic fields.

Not many people can do this, but Dr. Burnet combines the happy faculty of being a scientist of the first rank and interpreter of the implications of what he has learned and found. The world would be a happier place if there were more individuals of this kind.

Six representative groups of viruses all well known to the author are discussed each as familiar entities. They are presented not as noxious agents or disease-producing agents per se but as agents which perhaps will continue to survive by virtue of their capacity to act like any other biologic agent, namely to adjust to their environment through evolution and change. In developing this theme Dr. Burnet believes that viruses are micro-organisms which have evolved by parasitic degeneration from larger micro-organisms, many of them in all probability bacteria. Their behavior is interpreted in terms of biologic variation or mutations when the environment is such as to favor the survival of the variant over the original form. Within this biologic pattern it is necessary to consider the effect on the virus resulting from its transfer from one host to another, and with it goes the suggestion that in the past all or nearly all of the known virus diseases of man might have been originally derived from animal infections.

The book is a prize for the shelves of the bacteriologist, the virologist and the epidemiologist and, in fact, any who are interested in the whys and wherefores of infectious disease.

The Road to Recovery from Illness: A Study of Convalescent Homes Serving New York City. Prepared by Elizabeth G. Gardiner and Francisca K. Thomas for the Committee on Convalescent Care Practice. Paper. Pp. 197. New York: Hospital Council of Greater New York, [n. d.].

One of the major adjustments with which the medical profession is confronted, both in private practice and in hospital planning and administration, concerns the rapid shift in the character of illnesses with which we have to deal. Acute disease has rapidly given way to chronic disease. The normal aging of the population and the lowering of the birth rate would naturally involve such a change in the balance, but this has been exaggerated by the success of preventive as well as curative methods of treatment in the infectious diseases. As a result we have been caught off balance, with resulting confusion for the administrative and hardship for the patient group that seeks aid.

The private hospital, because of increased occupancy during the war years, resorted to the simple expedient of discouraging the admission of the chronic case and of pushing the convalescent patient out as rapidly as possible. Public hospitals in many instances have followed a similar pattern—few have squarely faced the problem. They have temporized with the immediate needs and have lagged even in planning to meet a situation that is becoming ever more obvious and pressing.

This study of Gardiner and Thomas will prove useful in stimulating an active interest in the subject as well as providing

factual data that will be useful. It presents the summary of cooperative efforts that began in 1920 with the appointment of a series of committees by the New York Academy of Medicine (Report of the Public Health Committee of the New York Academy of Medicine: Institutional Convalescence: Standards for the Care and Management of Convalescent Homes, New York, 1925) and which have been under consideration at various times since that time.

While Gardiner and Thomas's study has been focused largely about the convalescent home, the scope includes some aspects of the care of the chronically ill as well. New York has been fortunate in the development of the Montefiore Hospital, a project that has pioneered in this particular field.

The study of the convalescent homes in the New York area was on a sufficiently broad basis (there are more than eight hundred institutions of this character in the region) to provide assurance that the recommendations made by the authors are worthy of careful consideration by every hospital administrator and physician.

The Falling Sickness: A History of Epilepsy from the Greeks to the Beginnings of Modern Neurology. By Owsel Temkin, M.D., Associate Professor of the History of Medicine at the Johns Hopkins University, Baltimore, Md. Publications of the Institute of the History of Medicine. The Johns Hopkins University, First Series: Monographs, Volume IV. Cloth. Price, \$4. Pp. 380, with 7 illustrations. Baltimore: Johns Hopkins Press, 1945.

A reader of medical books does not every year find in his hands a new book which opens a world of rare and ancient treasures. This joy of discovery belongs to the reader of Dr. Temkin's book on "The Falling Sickness." The art of printing rescued from molding destruction the hand written manuscripts of medical lore. However, these and many later writings are again inaccessible because of the decay of Latin and Greek as the physician's chosen means of written communication. With painstaking labor the author has combed the literature of the ancient and medieval worlds for explanations and treatments of the weird disease of sudden falling. He has sought the opinion not only of noted physicians and university professors but also of village practitioners, charlatans, functionaries of the church and the common man. The result is not only a panorama of seizures but a view of the painful progress of medicine, of science and of human relations from Hippocrates to John Hughlings Jackson. Therefore the book is not merely for the epileptologist but for all physicians and indeed all educated people who wish to increase the depth and the perspective of their knowledge and their sympathies.

Following are the main divisions of the subject: antiquity; middle ages; renaissance with its theological, philosophical and social aspects; the great systems of the iatrochemists and the iatrophysicists, of animism and eclecticism, the fight against the supernatural and the occult; and, finally, the nineteenth century. The 706 references, the index of about 700 personal names and the 1,717 footnotes attest the scholarship of the book. Six illustrations of seizures add interest to the text. The paper and binding are of prewar quality. The modest price of the volume is explained by use of the Epilepsy Medical Research Fund of Johns Hopkins University.

The best news for the general reader is saved for the last. The writing is clear, readable and at times amusing. Many books have been written about epilepsy, but this book has no historical rival. It occupies a separate shelf in the reviewer's Library of Fame.

Straight Down a Crooked Lane. By Martha Byrd Porter. Boards. Price, \$3. Pp. 231, with illustrations by Hans Jellinek. Richmond, Virginia: Dietz Press, Inc., 1945.

To the collections of personal memoirs like "Life with Father" is added this account of the life of a doctor and his wife, told by a lady with a sense of humor. Dr. Porter has practiced in Richmond for a good many years, and Mrs. Porter has observed with him the comings and goings of the medical elite and has indeed gone with him to some of the far places in the world. Like most doctors' wives, Mrs. Porter has had a full life. She tells about it gleefully. James Branch Cabell says it is "a lively, uninhibited volume which richly, in my judgment, merits praise. A beautiful book, alike in format and its matter."

PENICILLIN IN EARLY SYPHILIS—SYPHILITIC REINFECTION

To the Editor:—Since the institution of penicillin therapy for syphilis in the Army I have come across 3 cases which have aroused considerable interest. In each of the 3, one course of 2,400,000 units of penicillin therapy for primary syphilis was administered. In all 3 the diagnosis was established on a dark field examination of the penile lesion. All three patients returned within a six months period with another penile lesion which revealed in each instance *Treponema pallidum* on dark field examination. I have been unable to find any definite information or reports available on the incidence of reinfection of primary syphilis. I feel that 2 of these cases are true reinfections because they are associated with a definite history of exposure and that the location of the lesion on the second recurrence is different from that of the first. The third case is questionable. Please advise regarding the incidence of reinfection in syphilis.

Alfred A. Diamond, Captain, M. C., A. U. S.

To the Editor:—I wish your opinion in a case of early syphilis treated by penicillin. There are lesions on the vulva of about one month's duration. Treatment has consisted of 3,000,000 units of penicillin in ten days. The Kahn reaction at the end of two weeks is still positive.

Don S. Fraser, M.D., Panama City, Fla.

ANSWER.—There is an enormous literature on reinfection in syphilis, reference to which may be found in any standard textbook, particularly the textbooks of Stokes and of Moore. In this connection the editorial entitled "The Changing Concept of Reinfection with Syphilis and Its Applicability as a Criterion of Cure" may be of interest. This appeared in the *American Journal of Syphilis, Gonorrhea and Venereal Diseases* (29:474 [July] 1945).

The information available indicates that, in early syphilis, a dosage of 3,000,000 units of penicillin in ten days is probably curative in 80 to 85 per cent of the patients so treated, assuming that the treatment is given by injections of an aqueous solution at intervals of not less than every three hours day and night. Failure of treatment, represented by reinfection, clinical or serologic relapse or seroresistance, is to be expected in 15 to 20 per cent. The blood serologic test of patients whose condition progresses satisfactorily becomes negative on the average from sixty to one hundred and twenty days after the initiation of treatment.

Patients so treated should be examined at monthly intervals for the first year, with clinical inspections and with quantitatively titrated blood serologic tests. In the absence of clinical manifestations and with a blood serologic titer falling to or toward seronegativity, the patient is progressing satisfactorily. On the other hand, the absence of quantitative serologic response, the presence of serologic relapse (as indicated by a confirmed rising titer) or the appearance of new clinical manifestations is an indication for retreatment. The patient's spinal fluid should be tested six months after the completion of penicillin therapy. If progress during the first year after treatment has been uneventful and seronegativity achieved, the patient may be checked during the second year every three months rather than once a month. Continued and prolonged observation for a minimum of five years is desirable. If relapse occurs, one may treat the patient again with penicillin, utilizing for the second course a total dose at least twice that originally administered, and combining with the second course a minimum of six injections of oxophenarsine hydrochloride given at the approximate dosage level of 1 mg. per kilogram, injections being given every other day.

AIR TRAVEL AND HYPERTENSION

To the Editor:—What is known about the effects of air travel on patients with essential hypertension? Can a patient of 56 with a blood pressure of 190/110 be permitted to travel by air? M.D., Massachusetts.

ANSWER.—Essential hypertension without complication is not a contraindication for air travel at usual airline flight levels. However, cardiovascular complications of hypertension are contraindications to air travel.

DERMATITIS FROM OILS AND SOLVENTS

To the Editor:—Eight men working in a neighboring plant engaged in manufacturing motors developed a dermatitis caused by sensitivity to cast iron dust, oils or solvents. In each case the diagnosis was quite definite, the history, character and distribution of the dermatitis being typical of an industrial dermatitis. The dermatitis cleared when they were removed from contact with these agents but recurred when they returned to the original work. These workers were then assigned to outside work, and the dermatitis remained away for a period of from three to six months in some of the cases and then recurred, even though there was no further exposure to the original irritants. It has always been my belief that the skin, like any other organ, after sustaining a severe initial injury could have subsequent attacks without further exposure to the original irritant.

M.D., Wisconsin.

ANSWER.—Since cast iron is innocuous as far as dermatitis is concerned, the industrial dermatitis was probably caused by oils and solvents. Since oils and solvents are encountered in many other places than in manufacturing motors, it is quite reasonable to deduce that those cases which recurred did so because the workmen again came in contact with oils or solvents. The type of dermatitis caused by cutting oils in general is different from that caused by solvents. Oils usually cause folliculitis, comedones and acne on the extensor surfaces of the forearms and thighs. Solvents cause an eczematoid dermatitis and usually affect the interdigital spaces, the fingers and the dorsum of the hands, although the forearms may also be involved. Subsequent attacks of dermatitis venenata cannot occur without subsequent exposure to the same irritant or a similar irritant. In the case of dermatitis from petroleum solvents, which act by defatting the skin, similar attacks of dermatitis may occur from contact with any of the solvents which also defat the skin, such as the chlorinated hydrocarbons, or even ordinary skin cleansers such as soap and water.

Peck, Samuel M.: Dermatitis from Cutting Oils, Solvents and Dielectrics, Including Chloroacne, *THE JOURNAL*, May 20, 1944, p. 190.

TOXEMIA OF PREGNANCY AND LATE SYPHILIS

To the Editor:—A woman aged 35 in her seventh month of pregnancy has positive Wassermann and positive Kahn reactions to syphilis, with a vague history of exposure over ten years ago. In addition she has swelling of the hands, pitting edema of the ankles and pretibial region and a blood pressure of 178/92; there is no nitrogen retention nor urinary albumin. She was hospitalized and given 3 million units of penicillin, with bed rest and sedation and a salt free diet; her blood pressure returned to normal limits in three or four days. She came into the office three days after leaving the hospital for arsenical treatment, but her blood pressure had risen again so she was sent home to bed. I should like to give this patient intensive arsenical and bismuth treatment. Is this advisable?

Robert L. Bestoso, M.D., Newport, R. I.

ANSWER.—Since the patient is manifesting evidence of toxemia of pregnancy, it would seem advisable to give a second course of penicillin for the syphilis. In addition to the salt free diet, sedation and additional bed rest should be continued. If the syphilis is of ten years' duration, the likelihood of her having a child with congenital syphilis is less than if the syphilis had been more recently acquired. Nevertheless, treatment for syphilis is necessary to endeavor to obtain for her a nonsyphilitic child. Penicillin is less toxic to the kidney and liver than antisyphilitic chemotherapy, which is the reason for giving the second course. The value of penicillin in preventing congenital syphilis has not been fully established, but at the moment the results are encouraging.

PRURITUS ANI AND ALLERGY

To the Editor:—I have under observation a man aged 57 who has been intensively treated for the last several years for a very severe pruritus ani, including surgery of perianal skin, and who is highly sensitized or allergic to a variety of common drugs, including aspirin, salicylates and the sulfonamides. A severe burning and itching rash breaks out repeatedly on his forearms and face; this is an acute dermatitis of the papulovesicular type. Any suggestions concerning desensitization or treatment of this patient will be appreciated.

M.D., New York.

ANSWER.—Desensitization to drugs is not likely to be successful. If this is attempted, the oral route should be used. Minute doses of the drugs—perhaps in the form of a solution to measure more accurately—are given daily in slightly increasing amounts. It should take approximately two months to reach the dose to be used therapeutically. Other allergic factors should be considered (Schapiro, Saul, and Albert, M. M.: *The Role of Allergy in the Production of Pruritus Ani*, *J. Invest. Dermat.* 4:219 [June] 1941). The presence of food allergy may be investigated by means of skin tests, trial diets or a combination of the two. It is possible also that the condition may be due to a fungous infection or to intestinal parasites.

PAROXYSMAL ABDOMINAL PAIN

A FORM OF FOCAL SYMPTOMATIC
EPILEPSY: II

MATTHEW T. MOORE, M.D.
PHILADELPHIA

One of the commonest complaints attending man from the cradle to the grave is abdominal pain. To enumerate the array of causes for such pain is not the province of this paper, but, in general, they originate not only from intrinsic disorders of the abdominal viscera but also from lesions of the thoracic viscera, spinal cord and peripheral nerves, and the more remote brain. It is the very multiplicity of these causes which often makes differential diagnosis difficult and elusive.

There is a small group, sufficiently large however and inadequately recognized to warrant further emphasis, in which the abdominal pain may have been present over varying periods of time without a demonstrable organic or psychogenic cause having been unearthed by the usual methods of study. What heretofore may have been considered unexplained abdominal pain obviously must have an explanation, and it is suggested that where this variety of pain exists study be directed to the possible existence of cerebral disease or dysfunction.

Exact localization of cerebral representation of gastrointestinal activity and abdominal pain is still not fully determined, but most data point to cortical mediation and possibly diencephalic influence. Fulton¹ has reviewed the early experimental work, beginning with Bochefontaine (1876), Hlasko (1887) and Bechterew (1911), indicating the evidence of cortical influence on gastrointestinal motility. Recent studies by Fulton and his co-workers,² Spiegel, Weston and Oppenheimer³ and Penfield and Erickson⁴ have confirmed and expanded the evidence of gastrointestinal representation in the cortex (areas 6, 5, 3 of Brodmann). Penfield and Gage⁵ have shown that abdominal pain may occur as an epileptic aura or an equivalent, and they describe pain arising in the lower right quadrant of

the abdomen followed by a convulsive seizure in a patient whose exposed brain was stimulated electrically in area 5a. In calling attention to the important subject of brain trauma and its relationship to disturbed function and production of lesions of the gastrointestinal tract, Cushing⁶ showed the probable role played by the diencephalon in this respect. Watts and Fulton⁷ also have demonstrated the effects of diencephalic lesions on the gastrointestinal tract.

From the clinical approach abdominal pain has been postulated as being a form of epileptic variant by Wilson⁸ and demonstrated in pure form by Moore.⁹ Klingman, Langford, Greeley and Hoefer¹⁰ have reported the cases of 12 children having unexplained attacks of paroxysmal abdominal pain in whom, by the history of associated manifestations of the convulsive state and the electroencephalographic findings of cerebral dysrhythmias, they concluded that the type of pain was an expression of an epileptic disturbance. Lambert¹¹ too has suggested that abdominal pain in children may represent a form of the convulsive state secondary to altered cortical function, as shown by electroencephalographic tracings in which the cerebral dysrhythmias were of the petit mal and psychomotor equivalent types.

Fits of varying forms, including abdominal pain, may result from a host of conditions producing either structural or physiologic changes in the brain. These causes have been amply enumerated and discussed by Cobb.¹² In the consideration of abdominal pain as a symptom of cerebral disease, Wechsler¹³ stated "I would call attention to the occurrence of abdominal pain, at times simulating appendicitis, renal colic, gallbladder disease and gastric or duodenal ulcer, in tumors of the brain. I have seen patients treated for a long time and even operated upon for abdominal syndromes which were the harbingers of brain tumors."

The following case reports constitute a group of individuals in whom abdominal pain was either the only symptom or an outstanding one, present and unrecognized over a considerable period of time, and in whom thorough history taking, detailed neurologic

examination and utilization of diagnostic aids including electroencephalography led to the consideration of the pain as a manifestation of focal symptomatic epilepsy.

CASE 1.¹⁴—P. P., a man aged 32, was referred by Dr. Marcel Sussman, June 4, 1941, with the chief complaint of periodic attacks of cramplike pain involving the entire abdomen. The pain often started in the lower right quadrant and then involved the abdomen throughout. At times the pain became so severe as to produce prostration and loss of weight. During the attack he had a "rumbling" sensation in the abdomen associated with considerable eructation. The seizures were not accompanied by headache or visual disturbances. He had never had diarrhea during a spell. Following the attack he was exhausted and felt "achy all over." The first attack occurred at the age of 9 months following the injection of diphtheria antitoxin. The attacks of abdominal pain came on at irregular intervals during his early life but during recent years have been very frequent, occurring about every seven or eight days, and during the week preceding the examination there were four seizures. At the age of 8 an appendectomy was performed during one of the attacks and a normal appendix was removed. He had been studied extensively and various diagnoses had been made, including hysteria, abdominal angioneurotic edema, abdominal migraine, psychogenic functional gastrointestinal disorder, hepatobiliary disease, enlarged colon, Dietl's crisis and diaphragmatic hernia. He received various forms of medication, including ergotamine tartrate, without obtaining relief. Both parents are living and there is no history of a similar condition existing in the immediate forebears. The neurologic examination showed no abnormal findings. Laboratory studies showed essentially normal findings, and previous x-ray studies of the gastrointestinal tract, urinary tract and gallbladder were negative. The blood pressure was 102 systolic, 68 diastolic, pulse rate 76, weight 139½ pounds (63 Kg.). Electroencephalography⁹ performed by Dr. Joseph Hughes showed large, low voltage, abnormal waves seen particularly in the right and left frontal regions. They were also present in the parietal and occipital lobes. This abnormal activity was increased with hyperventilation. The patient was placed on anticonvulsant therapy consisting of diphenylhydantoin sodium (dilantin sodium) 1½ grains (0.1 Gm.) twice daily and a bromide mixture 1 fluidrachm (4 cc.) four times daily. He remained attack free for seven and a half months, when medication was withdrawn, resulting in a return of seizures. On resumption of medication he was free from attacks until July 16, 1942, at which time a placebo was substituted in the diphenylhydantoin sodium capsules (the bromide mixture having been discontinued for some time) and again the attacks returned within fifteen days. The patient was terribly alarmed, believing the diphenylhydantoin was no longer effective, but when told about the experiment he was gratifyingly reassured. During the time he was attack free his weight rose from 139½ to 163 pounds (from 60 to 74 Kg.). He has been taking diphenylhydantoin sodium 1½ grains twice daily regularly and to the present date has been entirely attack free.

This patient had previously been treated for numerous conditions, among which was so-called abdominal migraine. He failed to respond to ergotamine tartrate. The periodicity of the attacks, their paroxysmal, abrupt onset, and their relatively short duration made it appear that the symptom was an abdominal epileptic variant. As indicated in the full case report,⁹ it was believed that the injection of diphtheria antitoxin had produced an angioneurotic edema of the brain with subsequent changes in the cerebral cortex which predisposed to abnormal cerebral discharges. These discharges were seen to occur predominantly in the frontal lobes, as

indicated by electroencephalography. The intense abdominal pain may be essentially intrinsic in the intestine, secondary to intense visceral contractions brought about by the abnormal cerebral discharges in the frontal and/or the parietal cortex.

CASE 2.—A. S., a man aged 43, was admitted to the Jewish Hospital to the service of Dr. Harold Goldburgh on May 1, 1944 with the admission diagnosis of enterocolitis. For six months prior to his admission he had been suffering from frequent attacks of severe abdominal pain associated with diarrhea, cold sweats, weakness and occasional loss of consciousness. At first the attacks occurred every eight to ten days and then increased in frequency, so that during the month prior to admission they occurred every day at least once and often several times daily. The past medical history revealed that at the age of 10 he had a head injury with a period of unconsciousness, the exact duration of which is not known. At the age of 12 he developed spells consisting of a "peculiar sensation" in the abdomen followed by a "prickly" feeling over the entire body, followed immediately thereafter by a cramplike pressure in the abdomen associated with "rumbling" and an awareness of the immediacy of a bowel movement. This was followed by a watery evacuation. This attack usually was accompanied with profuse sweating. In addition to these attacks he had spells consisting of blanching of the face, unconsciousness and falling to the floor, followed by "twitchings" (convulsive movements?) of the arms and legs and at times frothing at the mouth. These seizures occurred at intervals of one to three months and continued up to the present disturbance, which began six months before his admission to the hospital. The past medical history revealed the usual childhood diseases. In 1939 he contracted undulant fever, for which he received fever therapy. There was nothing in the remainder of the history to indicate any emotional disturbances. The patient is married. Both parents are living and well. Three brothers and one sister are living and well; a fourth brother is a mongoloid idiot. There is no history of epilepsy in the immediate or collateral members of the family. The blood pressure was systolic 145, diastolic 90. Laboratory studies revealed blood calcium, urea, sedimentation rate, Wassermann reaction, urinalysis, gastric analysis and the feces all normal. The sugar tolerance test was normal. The leukocyte count showed a low normal of 5,000 cells with 6 per cent eosinophils. Examination of the chest and abdomen was negative. X-ray studies of the entire gastrointestinal tract were reported as indicating the presence of enterocolitis and duodenitis. X-ray examination of the skull showed no abnormalities. The spinal fluid examination was negative. The neurologic examination showed the cranial nerves to be normal; sensation was preserved throughout the body in all modalities and was equal on the two sides; the tendon reflexes in the upper limbs were extremely prompt and there was a distinct preponderance on the left side; the knee jerks and ankle jerks were overactive and again there was increased activity on the left as compared with the right. Pathologic reflexes could not be brought out. Electroencephalographic studies performed by Dr. Donald Scott showed "that the alpha rhythm of 9.4 per second was equal and very persistent on both sides of the head. The general level of activity was low normal, while the pattern showed no irregularities whatever. A satisfactory hyperventilation resulted in no change in the record. In the absence of any abnormality, the record was not suggestive of the nature or origin of the patient's complaint." It was suggested that the patient be given diphenylhydantoin sodium 1½ grains twice daily. The attacks ceased until June 1944, when he stopped taking medication. Within two weeks he developed attacks of abdominal pain, which occurred almost daily. During October 1944, at a time when he was not taking diphenylhydantoin sodium, the attacks occurred several times daily. He finally resumed medication on Dec. 12, 1944, taking ¾ grain (0.05 Gm.) of diphenylhydantoin sodium four times a day. There was immediate relief, and during a recent interview he stated that he has been feeling better than at any other time in his life.

14. This case is reported in full by Moore⁹

The spells from which this patient has suffered over a period of thirty-one years usually occurred with explosive suddenness and often were preceded by a "peculiar" sensation which the patient had difficulty in describing adequately. This sensation is similar to that experienced in the epileptic aura. During the six month period preceding admission to the hospital he had predominantly abdominal pain as the main feature of his spells. These not infrequently terminated with unconsciousness, although not invariably so. There is a history of a head injury at the age of 10 and the onset of seizures at 12. Although the electroencephalogram failed to show abnormal cortical discharges, the immediate response to treatment with diphenylhydantoin sodium and the subsequent return of symptoms on cessation of treatment, and again the relief of the paroxysmal abdominal pain by resumption of anticonvulsant medication, would indicate the nature of the complaint being of an epileptic order. Gibbs and his associates¹⁵ in their analysis of 175 cases of post-traumatic epilepsy have shown that the electroencephalographic evidence of focal cerebral discharges occur in 51 per cent and generalized discharges in 41 per cent and that normal electroencephalograms occur in 8 per cent. They also state, "however, it must be recognized that a normal electroencephalogram does not exclude the possibility that a patient has brain damage or post-traumatic epilepsy."

CASE 3.—A. D., a girl aged 3 years, was admitted to the Jewish Hospital to the service of Dr. Samuel Goldberg, May 24, 1944 with the admission diagnosis of rickets. She was unable to talk, obeyed commands indifferently and had no control of bowel or bladder function. For many months she had periodic, abrupt attacks of crying, screaming and thrashing about, coming on without apparent cause at irregular intervals during the day. If the child was spanked, she seemed to go into a stupor and became rigid. She had been delivered normally at full term. At the age of 5 months she developed attacks of abdominal pain, which caused her to double up and cry out. The attacks were of short duration and occurred both diurnally and nocturnally. Following the individual seizures of abdominal pain the patient urinated and then slept three to four hours. Roentgen studies of the entire gastrointestinal tract showed nothing abnormal. From 6 to 11 months of age there was a period of relative quiescence with only occasional attacks of abdominal pain. In 1942 studies revealed an enlarged thymus gland and low blood calcium. A diagnosis of intestinal tetany was made and the patient was treated by irradiation of the thymus gland and the administration of calcium salts. Although less frequent, the spells of abdominal pain persisted until July 1943, since which time the abdominal pain has ceased.

The child walked at 17 months but failed to develop normally as regards talking and behavior. Both parents are living and well. There is no history of rheumatic fever, syphilis, tuberculosis, diabetes, epilepsy or mental disease in the family. Ophthalmoscopy before admission to the hospital revealed bilateral optic atrophy.

The neurologic examination showed that the child was capable of walking but presented pronounced mental deficiency. Both fundi showed atrophic disks. There was a definite defect in hearing. Over the skin of the nose and maxillary region there were small elevations of the skin in a butterfly configuration characteristic of the nevus multiplex of Bourneville (sebaceous adenoma of Pringle). Complete laboratory studies, as regards blood chemistry, blood count, blood Wassermann, blood calcium and phosphorus and urinalysis were negative. X-ray examination of the skull revealed no abnormalities. The triad of mental

deficiency, nevus multiplex of Bourneville and epileptoid manifestations first shown by abdominal pain and then by bouts of uncontrolled temper tantrums of a convulsive state pattern led to the diagnosis of tuberous sclerosis.

The diagnosis of tuberous sclerosis was made at the last admission to the hospital on the basis of the finding of the characteristic lesion over the skin of the face, together with mental deficiency and the interpretation of the abdominal pain and behavior disturbances as a convulsive state manifestation. The attacks of abdominal pain, which were originally diagnosed intestinal tetany, came on abruptly, were episodic and were of short duration, followed by exhaustion and deep sleep. This description fits into the seizure pattern of epilepsy. Another interesting phase of the history was the stupor and rigidity following on the child being spanked, which might well be the so-called reflex epilepsy.¹⁶ Although pneumoencephalography was not performed because of refusal by the parents, one can visualize the characteristic morbid changes in the brain being well scattered and involving the premotor cortex in area 6 and the parietal-sensory cortex in areas 3 and 5, which presumably influence intestinal activity (2, 3). The substitution of the bouts of abdominal pain by abrupt attacks of abnormal behavior occurring without apparent cause is probably also an exhibition of the convulsive state.¹⁷

CASE 4.—N. T., a boy aged 11 years, was referred by Dr. Ehrich Urbach, Dec. 11, 1944 with the history of attacks of unconsciousness, three of which had taken place during the past four years, numerous interval seizures of abdominal pain, nausea, occasional vomiting and diarrhea. The first episode occurred four years before, at which time he was unconscious and had convulsive movements, followed by a period of confusion. After a free interval of one month he had a second seizure. During July 1944 he experienced an attack of severe abdominal pain, following which he vomited and had diarrhea, the entire spell lasting about ten minutes. Prior to this he had had periods, lasting several months, of intermittent seizures consisting of waves of abdominal pain which came on about twice weekly with free intervals of six months to one year. These bouts of abdominal pain usually lasted from two to three minutes and occurred at intervals of two to ten minutes apart, the total "wave" lasting approximately one hour. These waves of abdominal pain occurred either in the morning or at night and were not accompanied with diarrhea or associated with unconsciousness. During the past year he had had frightful nightmares and talked in his sleep. His most recent attack, taking place when he was in bed, occurred two weeks before the present examination. He developed a headache, was nauseated, had a desire to defecate, and developed pain in the lower abdomen. The pain in the abdomen persisted and he experienced a feeling of suffocation. While in bed he had a continuous desire to move his bowels. After a period of several minutes he lost consciousness. Later in the evening, when he was found by his parents, he seemed confused. Following these bouts of abdominal pain there was always a short aftermath of slight confusion.

Five years prior to examination he sustained a severe head injury, having struck his head against a tree while sledding down an incline. He was unconscious for twenty-four hours. His previous history as regards delivery was normal, and he had the usual childhood diseases such as measles, mumps and chickenpox. The child was somewhat pudgy. The neurologic examination revealed that he was alert, and there was no disturbance in his mental sphere. The cranial nerves showed no abnormalities. There were no disturbances in motor dynamics.

Coordination, sensory endowments and tendon reflex activity were normal throughout. Examination of the chest and abdomen showed no morbid changes of the viscera. The blood pressure was systolic 98, diastolic 56; the pulse rate was 86, the weight 95 pounds (43 Kg.).

The patient developed attacks of abortive grand mal epilepsy one year following a severe head injury; these fits did not

galactogluconate (calcibronat-Sandoz) $\frac{1}{2}$ drachm (2 Gm.) dissolved in water three times daily. Following this form of medication there was an almost immediate cessation of the attacks of abdominal pain, and no grand mal seizures occurred. At the last examination on March 13, 1945 the patient had been entirely free from abdominal seizures and had shown much improvement in his mental acuity.

Fig. 1.—First electroencephalographic tracing in case 4.

have a stereotyped or well defined pattern. The attacks were characterized mainly by unconsciousness, questionable clonic and tonic phase, postictal confusion, and on two occasions loss of bowel and bladder control. In addition to this there were episodes of abdominal pain which occurred at irregular intervals and which came on paroxysmally in waves. These attacks of abdominal pain, followed occasionally by a short period of confusion, might well be the result of abnormal discharges in the frontal or parietal lobes. It was felt expedient, therefore, to have electroencephalographic studies done as well as x-rays of the skull. The latter were negative. The former were interpreted by Dr. Donald Scott to be as follows (fig. 1): The alpha rhythm of 9 per second was equally persistent on the two sides of the head. The general level of activity was considerably increased above normal limits, owing largely to the presence of slow waves, which could be seen on all leads. These occurred both singly and in groups, and, while they gave no indication of a focal origin, they were somewhat more persistent in the frontal area than elsewhere. It was interesting that this type of activity was almost wholly abolished when the patient opened his eyes. In frequent instances this slow wave activity was organized into typical groups of spike and slow wave forms, which were bilaterally symmetrical. No hyperventilation was attempted. Impression: The decidedly abnormal activity which was seen in this record was strongly suggestive of the type of disturbance usually seen in cases of idiopathic epilepsy. In view of the history of trauma, particular care was taken to find a focal origin, but, while some groups of slow waves reversed on the left, an equal number reversed on the right and even more frequently the activity was bilaterally symmetrical. Also it has been our experience that, unless the damage is very severe, focal activity will not be seen from all areas of the cortex. In conclusion, the record most closely approximated the pattern seen in idiopathic epilepsy.

It will be seen from the description of the electroencephalographic findings that the slow waves were found mainly in the frontal lobes, although there was a diffuse scattering of abnormal discharges throughout the brain. It was concluded, therefore, that the patient had a form of post-traumatic epilepsy manifesting itself in two varieties: one, an abortive form of grand mal (three seizures in four years); two, a frequent, interval variety assuming the characteristics of abdominal epilepsy.

On Dec. 26, 1944 the patient was directed to take $1\frac{1}{2}$ grains of diphenylhydantoin sodium twice daily and calcium-bromine-

The fact that the slow waves were usually in groups and often were bilaterally symmetrical, as well as most pronounced in the frontal area, pointed to the first possibility, while the single spike and slow waves, which reversed on the left, looked more like scarring. Taken as a whole, the record showed some 30 per cent less abnormal activity than the earlier study.

This patient had sustained a severe head injury five years before first being seen by the examiner. One year thereafter he developed an overt loss of consciousness with convulsive movements, the exact nature of which were not adequately described by his parents. This seizure was followed by attacks of abdominal pain which came on abruptly, lasted from two to three minutes and which appeared at intervals in a "wave-like manner," the entire cycle lasting up to one hour. The attacks of abdominal pain at times were accompanied by nausea and diarrhea and occasionally with vomiting. The electroencephalographic findings of

Fig. 2.—Second electroencephalographic tracing in case 4.

abnormal cerebral discharges, akin to those seen in idiopathic epilepsy, predominantly in the frontal lobes, would indicate that the seizures of abdominal pain represent an epileptic variant. Moreover, the immediate and continued response to anticonvulsant medication would again point to the relationship of the abdominal pain to cortical dysfunction. In addition,

the electroencephalographic findings with the patient under medication (fig. 2), showing the 30 per cent damping out of the previously existing abnormal discharges, indicates the action of the anticonvulsant drugs¹⁸ and the tendency to permit the focal nature of the discharges to come to the fore. It will be seen in this case that the dominant form of attack was that of paroxysmal abdominal pain occurring in a seizure pattern corresponding to that found in typical epilepsy. Only three attacks of abortive grand mal occurred during the five year period dating from the head injury. The abdominal pain was by far the more annoying and persistent difficulty which had eluded treatment prior to the administration of diphenylhydantoin sodium and the calcium-bromine preparation.

CASE 5.—R. Van O., a youth aged 19 years, was referred by Dr. Raymond Katzen on Nov. 24, 1941 with the history of having had periodic bouts of scintillating scotomas, severe headaches and abdominal pain. These attacks were initiated with scotomas composed of flashes of silvery white flickering light, forming an arc in the visual field. Immediately following this, pain developed over the right eye and in the right temporal region. The headaches were then followed by abdominal pain. These attacks usually began in the morning. Preceding the attack the patient's face became ashen white and his hands blanched. He had five such attacks during the year preceding the examination. In addition to these seizures he had frequently been found to walk in his sleep, of which fact he had been entirely unaware except on several occasions when he had fallen downstairs and regained consciousness as a result of the tumble. At 2½ years of age he had a severe head injury with the formation of a hematoma over the right side of the forehead. Scintillating scotomas began at the age of 4. During the past year the attacks had always been accompanied by the abdominal pain, which invariably followed the headaches. These spells lasted from several minutes to as much as one or two hours.

Both parents were living and in good health. His mother, in her youth, was a somnambulist. A maternal grandfather likewise was given to sleepwalking. Two siblings were well and did not suffer from a similar condition. No member in the immediate family or collateral members had headaches or a similar condition.

The patient was cooperative, was well developed physically and showed no evidence of endocrine dysfunction. Examination of the cranial nerves revealed that they were entirely normal. There were no defects of motor dynamics. Tendon reflex activity throughout the body was normal and equal. Pathologic reflexes could not be brought out. There was no disturbance in cerebellar function. Sensation was preserved throughout the body in all modalities. Other phases of the neurologic examination were entirely normal. Blood pressure was systolic 120, diastolic 68; pulse rate 72. X-ray studies of the skull revealed no abnormalities. Complete laboratory studies gave only normal results.

The episodic nature of the attacks, their abrupt onset, their relatively short duration and the associated history of somnambulism prompted me to have an electroencephalogram performed so as to determine whether the entire symptom complex was of a migrainous nature or epileptic in origin. The electroencephalographic studies were carried out by Dr. Joseph Hughes, who reported (fig. 3) that there were slow 5 to 7 per second waves seen throughout both hemispheres, particularly in the frontal and parietal regions and in the left occipital lobe. The rhythms of the right occipital lobe came through at 9 per second. These 5 to 7 per second ranged from 10 to 30 microvolts in amplitude. After a period of hyperventilation,

large, slow, abnormal waves varying from 50 to 100 microvolts in amplitude and from 3 to 6 per second in rate appeared in both hemispheres. These were definitely abnormal. This electroencephalographic response was indicative of some type of increased cortical irritability. There was no evidence of any focalized lesion.

The patient had received medication designed to control what formerly had been considered migraine, but to no avail. After the electroencephalographic report indicated presence of abnormal cortical discharges, he was given diphenylhydantoin sodium 1½ grains twice daily, and phenobarbital ¼ grain (0.016 Gm.) three times daily. On May 4, 1942, a little less than six months after the institution of treatment, he developed a mild attack while at work. He had had no somnambulist excursions, however, during this period. During October 1942 he still had been free from headaches, abdominal pain and scintillating scotomas. He had gained 8 pounds (3.6 Kg.) and was feeling better than he had for many years. During that month he was anxious to enlist in the armed services and, contrary to the advice of his physician and parents, enlisted without informing the induction board of his symptoms and the electroencephalographic findings. He entered the Air Cadet Service and for a time continued to take his medicine without the knowledge of the officer in charge. When the supply of medication was gone he began to develop attacks of exactly the same nature as those of which he originally had com-

Fig. 3.—Electroencephalographic tracing in case 5.

plained. He was studied by the medical examiners of the Army Air Force, resulting in his discharge from the Army on a medical certificate.

This patient had formerly been treated for migraine. However, careful evaluation of the symptoms and the associated sleepwalking, together with the history of head trauma during childhood, made it imperative to rule out the possible existence of the convulsive state as the correct explanation. It has been suggested by Wilson⁸ that scintillating scotomas and headaches may be epileptic variants and are to be differentiated from true migraine. Gowers,¹⁹ Oppenheim,²⁰ Riley²¹ and Cobb²² have indicated the probable relationship between migraine and the epileptic state and the need for distinguishing one from the other. Somnambulism has been considered as an epileptic variant. The abdominal pain in this patient occurred as part of the constellation of scintillating scotomas and headache. The electroencephalograms showed definite evidence of abnormal cerebral discharges, the disturbance appearing mainly in the frontal and parietal areas.

CASE 6.—Mrs. P. P., aged 44, referred by Dr. Lynn Rankin on May 4, 1944, gave as her chief complaint abdominal pain. She stated that her present condition dated back twelve years. Ten years before, because of repeated abdominal pain, she had her appendix removed, the biopsy of which showed no morbid change. The symptoms continued. During the past ten or twelve years she consulted numerous physicians of various specialties without being relieved by many forms of medication and treatment. The individual attacks consisted of what she described as a "gnawing" disturbance followed by generalized pain in the abdomen, accompanied by a "rumbling noise in the intestine." Occasionally the abdominal pain was accompanied by a "funny, dazed feeling," and she often feared that she was going to "pass out." She had never lost consciousness during these spells, however. The attacks occurred mainly at night. On three occasions, all of which occurred while in bed, the attacks of abdominal pain were associated with "shaking" of her limbs and jaws which she was unable to control, the entire episode lasting from ten to fifteen minutes. These attacks sometimes awakened her from sleep. She had not complained of headaches, nausea, vomiting or diarrhea preceding, during or subsequent to these attacks. In some of the episodes of abdominal pain she noticed that the sensation would extend into the chest and up into the head. During the four month period prior to examination, the seizures occurred about twice weekly. She had had free intervals lasting not more than one week. She lost about 10 pounds (4.5 Kg.) during the last eight months. The past medical history revealed no evidence of meningitis, encephalitis, head injury or serious illnesses. She had been married nineteen years, and her husband was living and well. There was no similar condition in the immediate or collateral members of the family.

The neurologic examination was entirely negative. There were no overt disturbances in her emotional or mental spheres. She appeared to be well adjusted in her marital life, and there were no difficulties in her social environment. Examination of the chest and abdomen showed no evidence of gross visceral disease. Previous x-ray studies of the gastrointestinal tract showed no morbid changes, and laboratory studies were entirely normal. Electroencephalographic studies done by Dr. Joseph Hughes showed no abnormal cerebral discharges of the type usually associated with the convulsive state. It was felt, in view of the nature of the seizures, together with the description of the "funny, dazed feeling," the occasional ascension of the abdominal pain into the chest and head similar to the aura preceding a typical grand mal fit and the pseudoconvulsive movements which had occurred on three occasions, that the abdominal pain was a form of abdominal epileptic-variant. Accordingly she was placed on anticonvulsant therapy consisting of diphenylhydantoin sodium $1\frac{1}{2}$ grains twice daily and phenobarbital $\frac{1}{4}$ grain three times daily. Medication was started April 24, 1944, and one week later she stated that there had been a cessation of the abdominal pains and a disappearance of the belching, and that she had improved generally. She has continued to remain on treatment and to date has not had a return of symptoms.

The physician who referred this patient stated that previous examiners had labeled her as a psychoneurotic, after failure to discover an organic cause for her symptom of abdominal pain. The irregularity of the attacks and their nocturnal appearance, aura-like sensations and myoclonic movements on three occasions indicated the epileptic nature of the spells of abdominal pain. The "rumbling noise," described in exactly this way by other patients, may be the auditory representation of increased intestinal activity.

This patient had a normal appendix removed, as did patient 1.

COMMENT

The 6 cases presented here have as a common denominator paroxysmal attacks of abdominal pain. In 2 cases (1 and 6) this happened practically in "pure" form. In case 4 the predominant seizures consisted of abdominal pain occurring in wavelike attacks which corresponded closely to the seizures described in cases 1 and 6. These three cases (1, 4, 6) had been studied quite intensively before the tentative diagnosis of abdominal epilepsy was entertained; 2 of these patients showed abnormal electroencephalographic findings characterized by slow waves occurring mainly in the frontal and parietal lobes. All 3 of these patients responded immediately and continuously to anticonvulsant therapy in the form of diphenylhydantoin sodium and bromides or phenobarbital. Patient 2, during a six month period preceding admission to the hospital, had seizures characterized predominantly by abdominal pain. The latter had been thought to be so-called enterocolitis; treatment in this direction failed to yield results. A careful evaluation of the history in terms of a head injury, periodic bouts of abdominal pain, diarrhea, cold sweats, weakness, occasional loss of consciousness, falling to the floor, convulsive movements of the arms and legs and frothing at the mouth all indicated the probable epileptic nature of the recently outstanding abdominal symptoms. Despite the negative electroencephalographic studies anticonvulsant therapy was begun, and during the time the patient cooperated and took medication he was seizure free.

It will be seen that 3 of the 6 cases had a history of antecedent head injury. One presumably had cerebral angioneurotic edema following the injection of diphtheria antitoxin, with a sensitization or morbid change in the cerebral cortex, and 1 case tuberculous sclerosis with undoubted morbid changes in the brain. Case 6 showed no etiologic background. Thus the majority of cases presented give historical evidence of disturbed cortical structure and function.

In view of the experimental and clinical data previously referred to²² that disturbances of gastrointestinal motility may be influenced by lesions involving the frontal lobe (area 6 of Brodmann) and the parietal lobe (areas 5 and 3), it may be argued that the attacks of abdominal pain experienced in the cases reported here was a manifestation of abnormal discharges occurring in the cerebral cortices, producing intestinal activity of a painful variety. The electroencephalographic findings in 3 of the patients seem to corroborate such a stand. Wechsler²³ observed in his study of abdominal pain as a symptom occurring in space-taking lesions of the brain that "most of the evidence presented points to the cortex and possibly to the frontal more particularly the premotor area as the source of neurogenic abdominal pains."

The 5 patients who were given anticonvulsants responded favorably and quickly to the use of diphenylhydantoin sodium alone or in combination with phenobarbital or bromides. Since the introduction of diphenylhydantoin sodium by Merritt and Putnam²⁴ into the armamentarium of anti-convulsant drugs it has

22. Fulton,¹ Watts and Fulton.² Watts.² Sheehan.² Spiegel, Weston and Oppenheimer.³

24. Merritt, H. H., and Putnam, T. J.: Sodium Diphenyl Hydantoinate in the Treatment of Convulsive Disorders, *J. A. M. A.* 111: 1068 (Sept. 17) 1938.

proved one of the most valuable in this field. Goldman¹⁸ has studied the effect of diphenylhydantoin sodium and phenobarbital on the electroencephalograms of patients suffering from severe epilepsy and has shown the damping out effect, by these anticonvulsants, of the abnormal cerebral discharges. This effect on the electroencephalogram was demonstrated in cases 1 and 4, the only 2 in which electroencephalographic studies were performed before and during treatment.

One half of the 6 cases reported here gave a history of head injury. This, as a possible cause of abdominal epilepsy,¹⁷ "is considered important at this time because of the strong likelihood of many cases of epilepsy or its variants finding their way into medical practice as the result of craniocerebral injuries and infections incident to World War II, and those which may appear with the return of the automobile and airplane to extended civilian use."

To establish the diagnosis of abdominal epilepsy and its etiologic background, it is necessary, in those patients presenting the symptom of abdominal pain, to observe the following steps in study:

1. Cases must be examined intensively, by all available methods, to rule out intrinsic disease of the pelvic, abdominal and thoracic viscera, morbid involvement of the spinal cord or peripheral nerves and psychosomatic projection mechanisms.

2. Historical data regarding the possible existence of cerebral disease or dysfunction should be uncovered.¹²

3. The behavioristic occurrence of the pain should adhere, in major respects, to the pattern of epilepsy so aptly stated by Wilson:²⁵ "Any fugitive, paroxysmal, disorderly, uncontrolled and recurrent manifestation of any neural process might be regarded as a fit, and this on any level of the neuraxis. . . . As for fits implicating visceral centers, there may be no interference with the conscious stream, no involvement of skeletal muscles and, in fact, none of the usual signs of epilepsy, so that divergence of the formula may be extreme. . . . The least mutable of accepted fit characters comprise sudden onset, brief duration and recurring habit; yet some forms are protracted (notably *epilepsia partialis continua*), repetitions may be extraordinarily infrequent, and brevity loses significance when the aura (as in some uncinata cases) is drawn out."

4. The presence of associated epileptic phenomena, either preceding or during the presenting episodes of abdominal pain, will form corroborative evidence of the nature of the disorder.

5. Positive neurologic signs and laboratory findings including cytologic and chemical studies, roentgenologic studies of the skull and electroencephalographic studies, indicating the existence of a cerebral structural or physiologic disorder, should be in evidence.

6. Salutary effects of anticonvulsant drugs on the occurrence of abdominal pain should be exhibited, and the influence of these drugs on the electroencephalogram should in most instances parallel the clinical results.

SUMMARY

Clinical study of 6 patients (2 children, 4 adults) in whom paroxysmal abdominal pain was either the only symptom or the dominant one revealed this to be a type of epileptic variant (abdominal epilepsy), as shown by the pattern of symptomatology, electroencephalog-

raphy and response to anticonvulsant drugs. Three of the patients presented the history of antecedent head injury; 1 had cerebral angioneurotic edema following injection of antiserum prior to the onset of abdominal seizures; 1 had paroxysmal abdominal pain diagnosed as intestinal tetany occurring in an unrecognized case of tuberous sclerosis; 1 showed no etiologic background.

There is need for recognition of unexplained paroxysmal abdominal pain, when study of the abdominal viscera has been negative, as being possibly of cerebral origin due to abnormal cerebral discharges arising in the premotor or parietal areas. These symptoms are liable to be present in the returning war veteran who has suffered a severe head injury, and there is likelihood of failure to evaluate its true nature.

The criteria for diagnosis are based on (1) exclusion of intrinsic visceral disease, (2) adequate historical data, (3) attack pattern of an epileptic order, (4) associated epileptic show, (5) objective evidence of cerebral organic disease or dysfunction and (6) effect of anticonvulsant drugs on the symptom of abdominal pain and on the electroencephalogram.

1813 Delancey Street.

ABSTRACT OF DISCUSSION

DR. STANLEY COBB, Boston: Dr. Moore is to be congratulated on his excellent clinical paper. The 6 cases are clearly presented and are convincing. I agree in his diagnosis and consider that his careful study should be taken as a model. I especially like his emphasis on history and the clinical descriptions of the seizures. The success of therapy with anticonvulsant drugs is another impressive part of the evidence which builds up his diagnosis. In case 2, in which the history is clearly that of epilepsy, there is a normal electroencephalogram. The author quotes Gibbs as saying that such normal tracings may occur in 8 per cent of patients with post-traumatic epilepsy. My experience is that many more than 8 per cent have normal electroencephalograms between attacks. If caught in an attack, of course practically every patient shows abnormal discharges. A normal tracing between attacks does not rule out epilepsy. On the other hand, the finding of abnormal waves is important evidence in favor of this diagnosis when the history and clinical description lead one to suspect epilepsy. I do not like the use of the terms "petit mal," "grand mal" and "psychomotor," as if all kinds of epileptic seizures could be classified under one of the headings. In a consulting practice one sees more "atypical fits" or "variants" than orthodox convulsions. Variations in consciousness with peculiar behavior are common and more important to remember than the textbook picture and "grand mal," in which the sequence of events is said to be aura, unconsciousness, tonic spasm and clonic jerks followed by stupor. Common enough, I grant, but any street car conductor can make the diagnosis in such cases. Dr. Moore merits our thanks for describing a variant that is not rare and is often wrongly diagnosed. Case 4 illustrates the point that "grand mal" and "petit mal" are not as useful terms as one is given to suppose. The fits are spoken of as "abortive grand mal," and certainly more of them were very far from being typical. The electroencephalogram showed "groups of spike and slow wave forms," which Lambert (quoted earlier in the paper) would call a dysrhythmia of the "petit mal type." The history of this patient clearly shows that he never had any fits remotely resembling "petit mal." In short, types of electroencephalographic wave and types of clinical fit do not correspond very well, and there is still much to be learned in this field. It may be of interest to point out that in 3 of these cases, to a striking degree, and in all of them to some extent, the symptoms resemble those of neostigmine poisoning. What could this mean in relation to epilepsy, the autonomic nervous system and acetylcholine?

DR. TRACY PUTNAM, New York: Dr. Moore has clearly brought out the characteristics and significance of the abdominal pain and other digestive disturbances which may occur as a form of epileptoid attack. In my experience such attacks are particularly common and puzzling in children, and I have studied a large number of cases since the original publication of Klingman, Langford, Greeley and Hoefer from this clinic. The occurrence of such attacks following head injury is of great interest and importance. I am particularly happy to hear his criteria for diagnosis so clearly enunciated. The boundaries of the still poorly explored territory of the epileptoid states are not clearly marked, and such definitions as he has formulated will do much to clarify them. If they are rigorously applied to other puzzling syndromes without obvious gross structural basis, and of paroxysmal nature, it is likely that we shall find still other new epileptic equivalents.

DR. E. A. SPIEGEL, Philadelphia: Dr. Moore's observations are a beautiful example of clinical application of experimental results. Fulton and his colleagues observed changes of gastrointestinal activity on stimulation of the so-called premotor area of the frontal lobe, while our group demonstrated that such effects could also be obtained from "postmotor" foci in the parietal lobe. We were also able to trace, by means of Marchi degeneration, descending fibers from these postmotor areas, which fibers joined the pyramidal tract system. Dr. Moore's observations corroborate these findings in that some of his cases showed abnormal discharges not only from the frontal but also from the parietal lobes. He is inclined to interpret the attacks of abdominal pain in these patients as due to gastrointestinal spasms elicited by impulses descending from these areas of abnormal cortical discharges. Such an interpretation seems justified in the majority of his material, in that signs of abnormal gastrointestinal activity were demonstrable during the paroxysmal abdominal pain. However, besides the stimulation of descending systems acting on the gastrointestinal tract, pain projected into the abdomen could also be produced by a somewhat different mechanism, namely by stimulation of cortical sensory areas receiving impulses from the viscera. Dr. Hunsicker and I observed changes of the electrocorticogram on stimulation of afferent fibers of the pelvic nerve, and Bailey and Boemer made similar observations for afferent vagal fibers. It seems to me that stimulation of such cortical sensory areas for afferent impulses from the viscera could play a role in cases like the sixth of this series, in which the sensation extended into the chest and up into the head.

DR. N. W. WINKLEMAN, Philadelphia: Evidence is gradually accumulating that the cerebral cortex is concerned with the motility of the gastrointestinal tract. Gross lesions, particularly of the frontal lobes, have been shown to produce abnormal intestinal movements. It may well be that hypermotility of the gastrointestinal tract on a known emotional basis may result from stimuli that also originate in the same cortical region. As an illustration of the first group, a man aged 45, whose initial symptoms were abdominal pains of such severity that he was actually "doubled up" gradually became stuporous and died within a period of four to five days. At autopsy a softened area in the fronto-motor-parietal area was found, into which hemorrhage had occurred. The 6 cases reported by Dr. Moore are interesting and instructive. In case 1 the temporal relationship of the first attack to the diphtheria antitoxin is somewhat vague, yet the patient must have been allergic in view of urticaria at a later date. This brings up the question of the effect of the antitoxin on the brain. Gøten and I (*Encephalomyelitis Following the Use of Serum and Vaccine, Am. J. Syph. & Neurol.*, 19:414 [July] 1935) have shown that an acute encephalomyelitis disseminata can develop in susceptible individuals from serums and vaccines. Permanent cerebral damage can result. I am sure that most of us would have first diagnosed migraine in case 5. The history of attacks of hemicrania preceded by scintillating scotomas is certainly suggestive of this condition. The history of somnambulism, however, suggests an added condition—epilepsy. Somnambulism can be a postepileptic automatism as well as an epileptic equivalent. Migraine and epilepsy are not unknown in the same patient and may be

related, as some believe. The abdominal pain in this case, therefore could have been either abdominal migraine or abdominal epilepsy. Dr. Moore told me that he too treated this patient for migraine before realizing that it was part of the epileptic syndrome. It was the natural thing to do. In the other cases the relationship between convulsions and the abdominal crises is more direct and more definite. Treatment for the convulsions in these cases should relieve or ameliorate the abdominal symptoms. The lesson taught by this paper is obvious. The nervous system can and does exert influence at a distance, and many apparently remotely removed symptom complexes may have as their basis some organic problem within the central nervous system.

DR. MATTHEW T. MOORE, Philadelphia: I wish to express my thanks and indebtedness to the discussers for their valuable and pertinent comments. I am completely at one with Drs. Cobb and Putnam regarding the epileptoid states and the nosologic inadequacy of such terms as "grand mal," "petit mal" and "psychomotor." These terms represent the mental conditioning of the physician as a means of orientation, but it must be stressed, as Dr. Cobb properly does and as I have done elsewhere,¹⁷ that "atypical fits" or "variants" occur more frequently than orthodox epileptic convulsions. Moreover, "they generally go unrecognized because, in Dr. Putnam's words, 'the boundaries of the still poorly explored territory of the epileptoid states are not clearly marked,' which poses the challenge to us of delineating more clearly these boundaries and of corraling the many vagrant forms into a recognizable group. Dr. Cobb's observation regarding the similarity of the abdominal symptoms to neostigmine poisoning is extremely interesting, since this thought had occurred to me at the time I was studying patient 1. The implications of this observation should be further explored experimentally in terms of the role played by the autonomic nervous system and the ultimate physiobiochemical mediators or effector agents which may produce the manifold expressions of the epileptic state. It is true, as Dr. Spiegel states, that abdominal pain, or pain projected to other visceral areas, may be due to stimulation of the cortical sensory areas receiving afferent impulses from the viscera, but this can occur with an unaltered normal cortex. This mechanism of afferent impulses stimulating either motor or sensory areas or both probably is the explanation for the phenomenon of so-called reflex epilepsy. However, in the majority of the cases reported here it is presupposed, on the basis of the history, neurologic data and electroencephalographic studies, that the abnormal discharges arise in the vicinity of disturbed cortical tissue, albeit these areas may be fired off by remote afferent impulses of the order described by Dr. Spiegel or by humoral factors. The case cited by Dr. Winkelman is a striking example of a gross cerebral lesion causing abdominal pain. It will be noted that both the frontal and parietal lobes were involved. With such material and the cases reported here as a basis on which to work, is it not likely, therefore, that many of the unexplained and commonly occurring attacks of abdominal pain may be due to abnormal discharges arising from sensitized, traumatized or morphologically altered areas of the frontal and/or parietal cortex?

Alcohol and Accidents.—Alcoholic intoxication is one of many factors contributing to traffic accidents. The factors contributing to accidents may be classified in the following four general categories: (1) driver factors, (2) road factors, (3) vehicle factors and (4) pedestrian factors. Driver factors are especially important and are made up of three classes: deficiencies in physical condition, lack of knowledge or skill and improper attitude. Physical deficiencies include not only permanent physical deficiencies, such as a lost arm or leg, but also such temporary deficiencies as those resulting from fatigue or the influence of alcohol. Many drivers with permanent physical deficiencies compensate for them, but it is difficult to compensate for a temporary deficiency such as the influence of alcohol.—Berry, Donald S., in *Alcohol, Science and Society*, New Haven, Quarterly Journal of Studies on Alcohol, 1945.

CLINICAL TRIALS WITH QUININE-
EPINEPHRINE INTRAVENOUSLY

P. J. HANZLIK, M.D.

AND

C. C. CUTTING, M.D.

SAN FRANCISCO

The successful current use of quinacrine (atabrine), orally and intramuscularly, in treating malaria has not relegated quinine to the scrap-heap of obsolete medicinals for this infection. Quinine has been widely used intravenously in civilian practice and in the armed services as an emergency measure in, or for initiating treatment of, the embolic or cerebral form of the disease, especially with coma. The effectiveness of the quinine, under these conditions, has not been challenged, but the safeness of the procedure has been considerably debated.

In general, clinical reports¹ have been rather opinionated without substantial support of the claims for or against using quinine intravenously. The possible hazard in the circulatory depression from quinine has been consistently recognized, although the intravenous procedures used have not always considered measures for controlling or combating this. The alkaloid has been given empirically with or without an antagonist. Intravenous epinephrine has been condemned by some almost as much as quinine. However, use of an appropriate antagonist with the quinine would seem to be desirable, at least, in depressed circulatory states, as in comatose patients with the embolic type of malaria.

Since nothing has been known of the scope of possibly desirable antagonists, Dreisbach and Hanzlik² made an extensive experimental study of this problem in several directions. Of some thirty-two agents tested, three were found to be effective against doses of quinine of therapeutic order. These were epinephrine, neosynephrine and calcium chloride, in descending order of efficiency and desirability. Epinephrine and neosynephrine were also the most effective antidotes of a number of those commonly recommended in severe circulatory collapse after high doses of quinine. In animals it made practically no difference, according to the percentage fall in blood pressure, whether the quinine was injected comparatively rapidly, or slowly, as for thirty minutes, advised clinically. Experimentally the choice agent was epinephrine, 0.015 mg. per kilogram of body weight, mixed with quinine sulfate 10 mg. per kilogram in isotonic solution of sodium chloride (U. S. P.). This dose of epinephrine prevented or mitigated the depressor action of the quinine, whereas 0.01 mg. per kilogram was not always adequate, and 0.02 mg. per kilogram considerably raised the blood pressure. The antagonistic action of the epinephrine generally was not successful after the third dose of quinine.

Translated to a 70 Kg. man, and assuming similar actions, the dose of 0.015 mg. of epinephrine per kilogram was the equivalent of a total dose of 1.05 mg., which agreed almost exactly with 1.0 mg. recommended by Escher and Villequez³ in 1931. The published report of these French army medical officers has been generally overlooked by others. As the result of an extensive experience with different methods of administering quinine in malaria in the tropics, Escher and Villequez recommended the following mixture for intravenous injection, especially for patients in shock or coma: 0.5 Gm. (up to 0.8 Gm.) of quinine hydrochloride and 1 mg. of epinephrine in 250 cc. of isotonic solution of sodium chloride injected in not less than thirty minutes. Escher and Villequez favored the general use of quinine intravenously in malaria as being the most effective medication and used it without epinephrine for noncomatose patients.

Practically in agreement with Escher and Villequez is a recent clinical report by Fitz-Hugh, Pepper and Hopkins⁴ which appeared after the experimental results of Dreisbach and Hanzlik were submitted for publication. These United States Army medical officers treated 6,059 patients with malaria in India, and of these 140 had cerebral malaria. They found that the great majority of patients with cerebral malaria required one or more intravenous injections of quinine dihydrochloride, 0.32 to 0.65 Gm., in saline or saline-glucose solutions, before they could be aroused enough to take oral medication. The drug was slowly administered and well diluted (200 cc. minimum—preferably 500 cc. or more) and caused no fatalities fairly attributable to its use. As to the value of epinephrine and of quinine intravenously and the precautions to be observed, they state that the intravenous administration of epinephrine (1 cc. of 1:1,000 solution well diluted) proved of value for certain comatose patients; if well tolerated it may be repeated, on relapse into coma, by venoclysis in isotonic solution of sodium chloride or saline solution with or without quinine dihydrochloride. Epinephrine, however, is not to be used routinely and is probably contraindicated in shock and pulmonary edema. The blood pressure response should be watched carefully and the administration discontinued if the blood pressure rises above 160 or the pulse rate is much accelerated or if other untoward symptoms appear. Intramuscular or oral atabrine may be used to supplement quinine, but they say that they have more confidence in quinine dihydrochloride administered intravenously, supplemented as soon as possible by oral quinine, than in any other specific in these cases.

More recently, MacDonald⁵ of the British army has advised combined operations in attacking malaria by using epinephrine intravenously to drive parasites out into the open and quinine at the same time orally, subcutaneously or intravenously. Marsh⁶ has stated that quinine and epinephrine given intravenously are usually necessary in the treatment of cerebral malaria, although prophylaxis with quinacrine daily will almost always prevent blackwater and cerebral malaria. Although the statements by Fitz-Hugh, Pepper and Hopkins summarize the essential features of using quinine intravenously in malaria, neither these authors nor

Escher and Villequez report details of possible circulatory and other changes in their patients, and MacDonald and Marsh give neither such details nor the dosage of drugs. These are common deficiencies in other clinical reports.

Therefore it was believed desirable to obtain some information on the possible general effects and tolerance of clinical intravenous injection of quinine-epinephrine, partly for confirmation or refutation of the clinical claims and partly to obtain familiarity with it in the event that such injection might be indicated in treating malaria. Safeness of the procedure was an important consideration. Such trials were made by one of us (C. C. C.) and his associates with 7 male patients from 18 to 48 years of age. In 3 of these (M. P., H. H. and C. W.) the initial circulatory state was about normal, although M. P. had a high pulse rate. In a fourth patient (C. A.) the initial blood pressure was above normal, the heart rate being about normal. Three other patients were in coma with circulatory depression, as the result of acute

at the end of thirty minutes. The diastolic pressure was also increased at the end of fifteen minutes in 4 of the patients, i. e. from about 16 to 33 per cent in excitable C. W., about 20 per cent in P. F. (paraldehyde), about 11 per cent in P. F. (alcohol) and about 14 per cent in R. S. (pentobarbital). Recoveries were incomplete at the end of thirty minutes. Three patients (M. P., H. H. and R. S.) showed no demonstrable changes in systolic blood pressure, and 2 (M. P. and H. H.) in diastolic pressure. No other effects were observed in 3 patients (M. P., H. H. and C. A.) and the coma remained unchanged in the 3 (P. F., P. F. and R. S.) who had taken alcohol, paraldehyde and pentobarbital. The most pronounced reaction occurred in the most excitable patient (C. W.), who was apprehensive and excited before the injection began. It is doubted whether the restlessness, suffocation, dyspnea and screaming which occurred one minute later were due to the procedure; complete recovery was present at the end of forty-five minutes. Respiration was

§ Systolic/diastolic in mm. Hg throughout. † Minutes after injection.

intoxication from alcohol, pentobarbital and paraldehyde. One injection of the following mixture was made into the median basilic vein in each patient: 0.5 Gm. of quinine bisulfate and 1.0 mg. of epinephrine hydrochloride in 250 cc. (5 patients) or 300 cc. (2 patients) during a period of thirty minutes. Blood pressure, pulse rate and respiration were observed before and at the end of fifteen minutes and of thirty minutes after the injection was begun. All patients were observed for at least twenty-four hours afterward. A summary of the essential data is presented in the accompanying table.

It is seen that the most consistent change was an increase in pulse rate fifteen minutes after the injection was started, i. e. from about 4 to 27 per cent in 6 of 7 patients. At the end of the injection (thirty minutes) the pulse rate had returned to the initial rate in all but the most excitable patient (C. W.). The systolic blood pressure was appreciably increased in 4 of the patients, i. e. about 5 per cent in C. A., in whom the initial pressure was the highest, 12.5 per cent in P. F. in paraldehyde coma and 37 per cent in P. F., in alcoholic coma, and 50 per cent in C. W., initially excited. Again these increases occurred at the end of fifteen minutes, with recoveries practically to the initial levels

variably affected in the comatose patients, being unchanged in P. F. (paraldehyde) and in R. S. (pentobarbital) and increased in P. F. (alcohol). Presumably the rather rapid recovery of consciousness and blood pressure was due to the metrazol in P. F. comatose from paraldehyde. The patients in alcoholic and pentobarbital comas who did not receive this treatment required much longer periods for recovery. Thus, in general, the principal reaction to a single injection of quinine-epinephrine, in the doses used, in conscious and comatose patients was a fleeting circulatory stimulation, principally an increase in heart rate; the blood pressure was moderately, though variably and temporarily, increased in roughly one half of the patients. Since this was confirmatory of the extensive experiences of Escher and Villequez and of Fitz-Hugh, Pepper and Hopkins, further trials were not believed necessary. We had no opportunity of trying the quinine-epinephrine mixture in malarial coma, but the mixture used by us was not detrimental, at least, in comas of drug intoxications.

It is of interest to compare the dosage of quinine, as base, used by us and the other reporters, since the salts used were different with considerable variation in

content of quinine. Generally the safeness of the procedure would vary inversely and its antimalarial efficiency directly as the dosage. On an equimolecular basis the amounts of quinine base in the single doses of the different quinine salts were as follows: 0.477 to 0.762 Gm. in 0.5 to 0.8 Gm. of quinine hydrochloride used by Escher and Villequez; 0.286 to 0.619 Gm. in 0.3 to 0.65 Gm. of quinine dihydrochloride used by Fitz-Hugh, Pepper and Hopkins; 0.345 Gm. in 0.5 Gm. of quinine bisulfate used by us; 0.338 Gm. in 0.7 Gm. of quinine sulfate for a 70 Kg. adult based on the standard dose used in animals by Dreisbach and Hanzlik. Accordingly, our doses, i. e. the clinical tried by us and those based on experimental work by Dreisbach and Hanzlik, which were close, were smaller than those used by the other reporters. Smaller doses would be less hazardous intravenously, but their antimalarial efficiency would also be lower, except that this disadvantage would be offset by a lower toxicity, which would permit injecting more doses. However, there seems to be no doubt that the higher range of dosage used by Escher and Villequez and by Fitz-Hugh, Pepper and Hopkins was used successfully, except that their maximum doses appear undesirable for general recommendation.

RECOMMENDED PROCEDURE

Although we did not test the dose of 0.5 Gm. quinine hydrochloride or dihydrochloride (0.477 Gm. base), partly because of the unavailability of these salts and partly because we were guided by the experimental results of Dreisbach and Hanzlik with a smaller dose, this had been included in the extensive trials of Escher and Villequez and of Fitz-Hugh, Pepper and Hopkins and used previously by others. It is believed to be sufficiently established and safe to be worthy of recommendation as emergency, or to initiate, medication for comatose patients with the embolic or cerebral malaria. The preferred procedure is as follows: 0.5 Gm. of quinine hydrochloride or dihydrochloride (0.69 Gm. of quinine bisulfate) and 1 mg. of epinephrine in 250 cc. of isotonic solution of sodium chloride injected during not less than thirty minutes. Not more than two or three such injections, or a total of 1 to 1.5 Gm. of quinine, should be given, properly spaced, within twenty-four hours. When consciousness is restored, medication is to be continued by mouth or through a nasal catheter as suggested by Fitz-Hugh, Pepper and Hopkins. The intravenous injection of quinine is probably contraindicated in severe shock, especially hemorrhagic, pulmonary edema, cardiovascular disease, cyanosis, severe anemias, pregnancy and possibly other conditions.

CONCLUSIONS

1. Intravenous injection of quinine has been widely used in the treatment of the embolic or cerebral form malaria with coma, but the safeness of the procedure has been considerably debated.

2. Experimentally it has been established that the circulatory depression accompanying such injections can be effectively antagonized by injecting epinephrine together with the quinine, but data indicating the clinical reactions to such a mixture have been lacking.

3. Trials made by us with a quinine-epinephrine mixture on 7 patients, 3 of whom were in coma from various drug intoxications, resulted in a fleeting circulatory stimulation, chiefly an increase in heart rate, the blood pressure being moderately, though variably and temporarily, increased in roughly one half of the

patients. In the majority there were no other demonstrable effects, and the comas were unaffected. These results sustain the claims of proponents of such medication.

4. Accordingly, quinine-epinephrine intravenously is believed to be sufficiently established and safe as emergency, or initial, medication for comatose patients with embolic or cerebral malaria, in agreement with recent practices of military medical services of different countries, which claim further that such medication is essential or indispensable in this type of malaria.

5. The preferred procedure is 0.5 Gm. of quinine hydrochloride or dihydrochloride (or 0.69 Gm. quinine bisulfate) and 1 mg. of epinephrine in 250 cc. of isotonic solution of sodium chloride injected in not less than thirty minutes. Not more than two or three such injections (total 1 to 1.5 Gm. of quinine hydrochloride) should be given, properly spaced, within twenty-four hours. When consciousness is restored, medication is to be continued by mouth or through a nasal catheter.

CLINICAL TETANUS

A STUDY OF FIFTY-SIX CASES, WITH SPECIAL
REFERENCE TO METHODS OF PREVENTION
AND A PLAN FOR EVALUATING
TREATMENT

EDWARD L. PRATT, M.D.

BOSTON

Tetanus continues to be a serious disease in spite of the availability of practical methods for its prevention and the use of improved serums and drugs in its treatment. In 1942 there were recorded 698 deaths in the United States from this disease,¹ and probably the number of cases was two to three times this figure.

Statistical studies dealing with large numbers of cases² have not been particularly useful in evaluating the results produced by any given program of treatment. The need for better methods to evaluate the results from the treatment of tetanus has become more urgent than ever because of the advent of purified antitoxins, recently developed anticonvulsant drugs and new chemotherapeutic agents.

Since the outcome of tetanus, either treated or untreated, depends in large measure on the severity of the disease, one must consider this factor in the evaluation of treatment. From an analysis of the clinical features of 56 cases of tetanus treated in the Infants' and Children's Hospitals from 1924 to 1944 it was possible to place the cases in a series arranged according to the severity of the infection. Such an arrangement enables one to ascertain readily the effects of treatment on the expected course of the disease. One of my purposes in this article is to describe the method of analysis that was used and to discuss some of the clinical implications derived from this analysis. The second purpose is to show the desirability of producing and continuously maintaining active immunity against tetanus as disclosed by a study of the initial lesions in these patients.

From the Department of Pediatrics, Harvard Medical School, and the Infants' and Children's Hospital.

W., Jr., Thompson, W. R., and Gordon, N. H.: Treatment of Tetanus with Antitoxin: Analysis of Outcome in 642 Cases, *Ann. Surg.* 105: 93 (Jan.) 1937.

METHODS

Each record was studied in its entirety in order to verify the diagnosis and to determine any unusual features. Then an abstract of each case was made covering only the following four features, which have been stressed by numerous investigators as the most useful indexes of the severity of the infection:³

1. The incubation period.
2. The length of time from the onset of symptoms to definite episodes of generalized muscle spasms.
3. The severity of the infection as judged by examination of the patient at the time of admission to the hospital.
4. The frequency and severity of spasms or convulsions after sedation, and the amount of sedation required each day.

No notation as to the method of treatment or the final outcome was made in the abstracts in order to eliminate any conscious or unconscious bias in analyzing the cases. Since all the patients were between 5 days and 12 years of age, the age factor was not included for analysis.

The abstracts were studied, using the four criteria mentioned previously, and the most weight was given to the length of time from the first symptoms until definite episodes of generalized muscle spasms occurred, and to the frequency and severity of spasms after sedation. Then the cases were arranged in a series from the most severe to the mildest. Several months later,

using the same abstracts, the cases were again graded as to severity, and no case differed in rank by more than three from its previously assigned position. Thus the reliability of the method was demonstrated.

RESULTS

Fifty-six cases were reviewed. There were 24 deaths, yielding a gross mortality rate of 43 per cent. The distribution of the cases and of the deaths in three

Fig. 1—Distribution of cases and deaths by age groups.

age groups is shown in figure 1. There were 39 males and 17 females, with mortality rates of 46 per cent and 35 per cent respectively. Nineteen patients were classified as having severe, 12 as having moderate and 37 as having mild generalized tetanus. Three patients had only local tetanus. In only 1 patient was the diagnosis doubtful. This patient, who died, is included in all figures, since treatment for tetanus was given.

The incubation period in patients classified as having severe generalized tetanus varied from five to ten days, with an average of seven and a half days. (The incubation period was known in 12 of these 19 patients.) The duration from the onset of symptoms to definite episodes of generalized spasms in these patients averaged one day, with a range from one-half to two and a half days. All these patients had pronounced trismus, generalized increase in muscle tone and great hyperirritability, with easily induced spasms or convulsions on admission, and all had severe spasms and 75 per cent had convulsions in spite of large doses of sedatives.

For patients with moderately severe tetanus the incubation periods were not definitely known, except for nine days in 2 patients. Generalized spasms occurred from one to three and a half days, with an average of

two and a half days, after the onset of symptoms. All had trismus, increased muscle tone and hyperirritability on admission, and after moderate to large doses of sedatives 6 patients had convulsions and all except 1 had severe spasms. In the patients with mild infections the progress of symptoms was slower and the severity of the spasms was less than in patients with severe and moderately severe tetanus.

The end result, the total amount of antitoxin and its routes of administration, the chief and contributing causes of death and the duration of hospital stay for 37 patients are shown in figure 2. In this chart the cases are arranged in order of decreasing severity of the disease. The 19 patients not shown had mild nonfatal infections. Only 1 of these 19 patients received anti-

Fig. 2—Cases of tetanus arranged in order of decreasing severity.

toxin intrathecally, and that patient had no reaction from the therapy. Although the order in which the cases in figure 2 were arranged was made without reference to the final outcome, it is interesting to note that, irrespective of the treatment given, for the first 25 patients death was the general outcome, whereas nearly every one of the patients with order numbers higher than 25, that is, with milder infections, recovered.

COMMENT

The Value of Arranging Cases in Order of the Severity of the Infection.—A reliable index of the relative severity of the disease can be obtained only by comparing several clinical features of the illness in any given patient with the same features in previous patients. In order to establish the rank of one patient with respect to

M.: *Tetanus*, in Cecil, R. L.: *A Textbook of Medicine*, ed. 6, Philadelphia, W. B. Saunders Company, 1943, p. 193.

others in the series, knowledge of the individual records is essential. Therefore, exact comparisons between series prepared in different clinics would not be possible. However, such an arrangement is practically the only useful aid in evaluating the various methods of treatment employed in any given clinic and in planning individualized therapy for each patient.

It is clear from a study of figure 2 that improvement in treatment can be confirmed by the results obtained only in patients with severe infections, that is, in patients classified with those whose infections previously were generally fatal. The superiority of a new method of treatment would be demonstrated if it enabled several patients to survive infections as severe as those in the first 25 patients shown in figure 2.

The Amount of Tetanus Antitoxin.—Study of figure 2 revealed no evidence that amounts of antitoxin up to 80,000 units were more effective than 30,000 units. In accord with this observation are the immunologic data of Spaeth.⁴ However, Vener and Bower,⁵ who reported 100 cases of tetanus with the low gross mortality rate of 29 per cent, advised a minimum of 200,000 units of tetanus antitoxin.

Route of Administration of Antitoxin.—Tetanus antitoxin was administered intrathecally to 5 of the 25 most severely ill patients and 3 of these 5 survived, whereas in the same group only 1 patient of the 20 given antitoxin intravenously or intramuscularly recovered. This evidence supports the contention that tetanus antitoxin injected into the subarachnoid space is more effective in the treatment of human beings with severe tetanus than an equivalent amount administered by other routes. However, the superiority of this route of administration of antitoxin is not so definite when one studies the distribution of the patients who recovered as shown in figure 2. Dietrich⁶ felt that many patients with tetanus, some of them with mild infections, died much sooner after being given antitoxin intrathecally or intravenously than they could have from untreated tetanus. Our cases support this point of view as regards tetanus antitoxin intrathecally. Patient E. B. illustrates that tetanus severe enough to have caused convulsions that produced fractures of four dorsal vertebrae can be survived without specific therapy, since his symptoms were subsiding by the time antitoxin was given:

E. B. (order number 33 in figure 2), a boy aged 6½ years, developed stiffness of the muscles of his neck and face eleven days before admission. Throughout the next six days there were increasing trismus and more generalized muscle spasms. On each of the last four days preceding admission a generalized convulsion occurred. There had been no fever, nor had any specific treatment been given. When admitted to the hospital on the eleventh day of his illness the patient displayed trismus, risus sardonius, generalized increased muscle tone and a mid-dorsal kyphosis. Although sudden stimuli produced painful generalized spasms, 0.8 Gm. of sodium amytal in divided doses each day produced satisfactory relaxation during the first few hospital days, and no sedation was required thereafter. Following negative tests for sensitivity, 12,000 units of tetanus antitoxin was injected intramuscularly on the day of admission. Roentgen examination of the spine revealed compression of the bodies of the fourth, sixth and seventh dorsal vertebrae and fragmentation of the body of the fifth dorsal vertebra. The symp-

toms of tetanus, which were subsiding by the time of admission, gradually disappeared, and the compression fractures of his vertebral bodies responded satisfactorily to treatment.

Of the group classified as having mild infections, only 2 patients died. These were 2 boys (order numbers 35 and 56) who were given tetanus antitoxin intrathecally. Therefore it would seem that antitoxin intrathecally was chiefly responsible for these deaths. The case report of 1 of these 2 is as follows:

G. R. (order number 56 in figure 2), a boy aged 11 years, was admitted to the hospital because for the past three days he had had a right torticollis, inability to open his mouth more than 2 cm. and pain in his right cheek. Except for slight retraction of his head backward and to the right, physical examination revealed no additional findings. There was no irritability or spasm of any other muscles, no dysphagia, nor any additional neurologic signs. The consensus was that the most probable diagnosis was mild tetanus, and he was treated according to the usual method of treatment in use at that time. Intradermal tests for sensitivity to horse serum were negative. Under ether anesthesia clear spinal fluid was removed by lumbar puncture and a smaller volume of tetanus antitoxin, equivalent to 10,000 units, was allowed to flow slowly into the subarachnoid space. At the same time 10,000 units of antitoxin was given intravenously. His temperature rose rapidly from 100 F. before the serum administration to 106 F.

TABLE 1.—Results of Treatment

Route of Administration	Severe + Moderate Cases Order Numbers 1-31		Mild Cases Order Numbers 32-56	
	Cases	Deaths	Cases	Deaths
Intramuscularly only.....	14	11	11	0
Intravenously plus intramuscularly...	10	9	10	0
Intrathecally plus intravenously and intramuscularly.....	7	2	4	2

four hours later. The patient became restless, but with no generalized spasms characteristic of tetanus. About ten hours after the serum had been given, the patient had a convulsion, then relaxed, had irregular respirations and died of respiratory failure.

Table 1 summarizes the results of therapy according to the route of administration of tetanus antitoxin for patients divided into two groups: severe plus moderate infections and mild infections. Table 1 illustrates the apparent superiority of the administration of tetanus antitoxin intrathecally, but of greater importance is its clear exposition of the serious nature of the reactions which may result from this type of treatment.

Type of Sedation.—Various types of sedation were employed in the treatment of the patients in this series. In general, solution of tribromoethanol and various barbiturates were employed, and no definite correlation could be made between the type of sedation and the final result. The sedation used for A. F. and C. R., who survived severe infections, is outlined in their case reports:

A. F. (order number 6 in figure 2), a girl aged 3 years, had an infected laceration of the scalp. The incubation period was seven days. Within twelve hours after the first symptoms a severe generalized convulsion occurred. The patient was sent to the hospital because of three more convulsions in rapid succession. At the time of admission she was having a convulsion which required ether anesthesia to control. Tetanus antitoxin 10,500 units was injected slowly into the lumbar subarachnoid space, an equal amount was given intravenously and 7,500 units was injected around the wound. For one hour

6. Dietrich, H. F.: Tetanus in Childhood, with Special Reference to Treatment, *Am. J. Dis. Child.* 59:693 (April) 1940.

after these procedures the patient was in poor condition as the result of vasomotor collapse. During each of the first eight hospital days she was given from 6.5 to 15 Gm. of sodium bromide and from 50 to 100 cc. of a 25 per cent solution of magnesium sulfate intramuscularly. In spite of this sedation two to three convulsions occurred each day. During this period an additional 32,500 units of antitoxin was administered intramuscularly in divided doses. Lumbar punctures were done one to three times daily. Serum sickness, with temperatures reaching 106 F., was present on the ninth, tenth and eleventh days. A few days later no sedation was required. The patient was discharged on the forty-third day.

C. R. (order number 6 in figure 2), a boy aged 2½ years and weighing 12.3 Kg., developed dysphagia, trismus and stiffness of the muscles in his back and the right side of his neck although there was no history of an injury. The following day he was brought to the hospital, where physical examination revealed inability to open the mouth more than 1 cm., spasm of all muscle groups, hyperactive reflexes, enlarged cervical lymph nodes and a nearly healed abrasion over the right knee. Shortly after admission, within thirty-six hours of the onset of symptoms, the patient began to have severe generalized spasms accompanied by cyanosis in spite of sedation. After tests for sensitivity were negative, 10,000 units of tetanus antitoxin was given intravenously and 10,000 units intramuscularly. On the seventh hospital day another 10,000 units of antitoxin

indicated for a patient with clinical tetanus merely because the lesion may be the site of elaboration of the toxin.

This does not mean that proper surgical care of injuries, irrespective of the presence of tetanus, is not essential when the nature of the injury is such as to require operative intervention. Likewise it is to be stressed that any injury which might result in tetanus should be given adequate surgical treatment at the time the injured person is first seen by a physician.

THE PREVENTION OF TETANUS

The methods of preventing tetanus are the proper immediate surgical treatment of injuries, passive immunization of injured patients with tetanus antitoxin and active immunization against tetanus. The latter may be accomplished by means of an initial series of injections, to be followed by "booster" doses of toxoid at the time of injury or by means of toxoid injections so spaced as to maintain adequate protection continuously. A consideration of the types of injuries constituting the probable ports of entry for tetanus spores in these 56 cases enables one to evaluate the methods of preventing tetanus.

The presumed ports of entry are given in table 2.

Group A, constituting 20 per cent of all the cases, consisted of injuries that usually would be treated by a physician and that were of such a nature that many physicians would feel it essential to give passive immunization with tetanus antitoxin or a "booster" injection of tetanus toxoid to patients previously actively immunized. Hence, theoretically, these 11 cases could have been prevented by active or passive immunization. In the present series only 1 patient (order number 11 in figure 2) was given passive immunization. The day after she sustained a compound fracture of her arm she was given 1,500 units of tetanus antitoxin, an amount generally conceded to be inadequate when an injury with much devitalized tissue is present.

Group B, constituting 20 per cent of the cases, represented injuries for which a physician was often not consulted and which are so infrequently accompanied by any sequelae that it is unlikely that passive immunization would be used. A physician might well use a "booster" dose of toxoid if the patient had been previously actively immunized. Hence, reliance on the use of passive immunization would probably not have prevented any of these 11 cases. It is doubtful if reliance on the method requiring the use of "booster" doses of toxoid would have prevented all of them, because medical advice was so seldom sought.

Group C, containing 60 per cent of the cases, presented injuries from which tetanus could not have been prevented by reliance on either passive immunization or "booster" doses of toxoid, because either the injury was unknown or was of such a nature that these methods of preventing tetanus would not ordinarily be utilized.

Therefore it is evident that tetanus will be most satisfactorily controlled by a program for active immunization which will produce and constantly maintain a high degree of immunity. An additional dose of toxoid should be given whenever an injury particularly prone to result in tetanus is sustained, because, at the present time, insufficient evidence is available to determine whether or not such a measure can be safely omitted, although infection with tetanus organisms probably would act as a "booster" dose. The most practical

TABLE 2.—Injuries Resulting in Tetanus

was administered intramuscularly. During the first thirteen days repeated doses of solution of tribromoethanol were used. A total of 1,400 mg. per kilogram of body weight was given during the first four days and 1,070 mg. per kilogram of body weight during the rest of the period. Because freedom from spasms could not be obtained through the use of solution of tribromoethanol alone, a 25 per cent solution of magnesium sulfate was injected intramuscularly repeatedly during the period from the fourth to the thirteenth day. The maximum amount given during a twenty-four hour interval was 100 cc. and the total amount used was 420 cc. The patient was discharged after fifty-two days in the hospital.

Surgical Treatment.—In these 56 patients surgical débridement of the site of the initial lesion was carried out on 9 patients classified as having severe infections without influencing the fatal course of the disease and on 3 patients with mild infections, all of whom recovered. The futility of surgical excision of the site of experimental tetanus infections in animals, once symptoms have appeared, has been conclusively demonstrated by Abel and his co-workers.⁷ Adequate amounts of antitoxin alone prevent the spread of tetanus toxin from its site of elaboration. This fact is manifested by the efficacy of prophylaxis by means of passive immunization. Hence there is no evidence that surgical intervention is

7. Abel, J. J., and Hampill, B.: Researches on Tetanus: Some Historical Notes on Tetanus and Commentaries Thereon, *Bull. Johns Hopkins Hosp.* 57: 343 (Dec.) 1935.

method of active immunization to maintain a high degree of immunity against tetanus is still to be determined, but the studies of Miller and Saito⁸ and of Peshkin⁹ indicate methods by which serologically adequate immunity can be achieved.

It is especially important to be sure that any patient who is given tetanus antitoxin is actively immunized subsequently. Several of the patients reviewed had received prophylactic tetanus antitoxin months or years previously, and the resulting sensitivity made serum therapy more difficult and increased the risk of serious reactions. The availability of serums prepared in other animals besides the horse has not entirely eliminated this problem.

SUMMARY AND CONCLUSIONS

A method for determining the relative severity of each infection in a series of patients with tetanus was adopted. Arrangement of 56 children with tetanus in order of the severity of the infection assisted in evaluating the various methods of treatment employed:

1. There was no evidence that administration of tetanus antitoxin in amounts up to 80,000 units was more effective than amounts of 30,000 units.

2. The administration of tetanus antitoxin intrathecally was suggestively, but not definitely, more effective than giving the same amount of antitoxin by the intramuscular or intravenous routes.

3. Fatal reactions occurred from tetanus antitoxin given intrathecally to some patients who in all likelihood would have survived their tetanus infections. Hence tetanus antitoxin should not be used intrathecally in any but the most severe cases, if it should be used at all, until a preparation is available which is incapable of producing severe reactions.

4. Excision of the site of infection, once clinical symptoms of tetanus were present, did not ameliorate the course of the disease.

That further reduction in the incidence of tetanus can be accomplished only by producing and constantly maintaining a high degree of active immunity against this infection was disclosed by a study of the initial lesions in these 56 patients.

War Neuroses.—One of the most striking phenomena seen in the conversion states, and one almost defying description, is the weird, wobbly, disorganized gait of astasia-abasia, with which so many of these patients are affected. The patient may be capable of perfectly normal movements in the sitting or the horizontal position, even though many of them display constant gross tremors of the legs only with great difficulty. The legs wobble about in every direction; the trunk is agitated by a series of uneven jerks. Time and again the patient seems on the point of losing his balance and toppling over, yet this seldom occurs. At other times the knees seem to give way altogether, causing the patient to sink to the floor. If the patient attempts to stand still, his body bobs up and down continuously. This condition is accompanied by little or no anxiety. The patient struggles persistently to control the wanton movements. He regards the disability as a disease of the nerves and muscles of the legs and does not see the actual relation between his symptoms and his war experience. In some cases the symptom appears as a transitory phase in the anxiety states.—Grinker, Roy R., and Spiegel, John P.: *War Neuroses*, Philadelphia, Blakiston Company, 1945.

THE TREATMENT OF EARLY SYPHILIS WITH PENICILLIN

MAJOR WILLIAM LEIFER

MEDICAL CORPS, ARMY OF THE UNITED STATES

The effectiveness of penicillin in the treatment of early syphilis in human beings was first recorded, in a preliminary report, by Mahoney, Arnold and Harris¹ in December 1943. Since then a number of publications² also of preliminary nature have appeared. It is my purpose in the present communication to detail the results of treatment of 96 patients, more than 70 per cent of whom have been observed for a year or more following treatment. These patients were treated between Nov. 17, 1943 and May 18, 1944.

MATERIAL AND PROCEDURE

The series consisted of 92 men and 4 women, 29 of whom were white and 67 Negro patients. They varied in age from 18 to 38 years, approximately two thirds being younger than 25.

Lesions of primary or secondary syphilis were present in every case, and the diagnosis was established in 89 by the demonstration of *Treponema pallidum* in the lesions, and in the other 7 by repeatedly positive serologic tests for syphilis. The approximate duration of the lesions was five to three hundred days, although in some 60 per cent of the patients it was less than thirty days. When treatment was initiated 19 patients were in the seronegative primary stage, 34 in the seropositive primary stage and 43 in the secondary stage. Two patients in the secondary stage had an additional complication, 1 syphilitic iritis, the other syphilitic periostitis of the tibiae. Besides early syphilis, 2 men had acute gonococcal urethritis and a third had suppurative inguinal lymphogranuloma venereum.

All patients were hospitalized and treated identically: they were given sixty intramuscular injections of 20,000 units of penicillin in 1 cc. of saline solution at three hour intervals, day and night, for seven and one-half days, a total of 1,200,000 units. Seventeen different lots of sodium penicillin, supplied by two manufacturers, were employed.

A titrated Kahn test and a Wassermann test of the blood were performed immediately before and after treatment, and these tests were repeated at monthly intervals, or more often, during the period of observation. The cerebrospinal fluid was examined before treatment in every patient and reexamined in most of them six months or more after treatment. Complete blood counts, urine analyses, estimations of nonprotein nitrogen or urea of the blood, icterus indexes and sedimentation rates were made before and after treatment in a large number of the patients.

REACTIONS TO PENICILLIN

A Herxheimer reaction occurred in 88 (91.6 per cent) patients during the first day of treatment. In 65 it consisted of fever, chill or chilly sensations, headache

and malaise. In 1 patient the temperature rose to a height of 105.2 F. but in most it was between 101 and 103 F. The temperature was practically always normal after twenty-four hours in spite of the uninterrupted administration of penicillin. Besides the febrile reaction 21 patients had a temporary exacerbation of the cuta-

Provocative effect of treatment on the titrated serologic test and the pattern of decline to a negative reaction in 3 typical cases.

neous and mucosal lesions, evidenced by increased swelling and redness and frequently by pain in the chancre and the enlarged regional lymph nodes. Two patients had exaggeration of the cutaneous lesions without a febrile reaction.

A number of minor reactions were observed after the first day of treatment. Several patients complained of mild abdominal cramps and nausea, of brief duration, and 2 patients vomited twice. Two patients had a secondary rise of temperature to 101 F. on several days during treatment. Two patients had mild urticaria lasting less than forty-eight hours; 2 had generalized pruritus without eruption; 1 had a papular multiform erythema, distributed over the elbows, forearms, knees and legs, that lasted about two weeks; 3 had herpes labialis and 2 herpes progenitalis following a febrile Herxheimer reaction.

No significant abnormalities of the blood counts, the nonprotein nitrogen, the blood urea or the icterus index were noted. The sedimentation rate was moderately prolonged after completion of treatment in 19 patients; the reason for this was not apparent.

TABLE 1.—Relapses Classified According to Stage of Disease, Type of Relapse and Time of Appearance

* Cerebrospinal fluid.

It is important to note that it was not necessary to interrupt or suspend treatment in a single patient on account of reaction.

RESULTS

Early Effects of Treatment.—Dark field examinations were repeated at three hour intervals after the onset of therapy in 26 patients with suitable lesions. Treponemes could not be demonstrated after periods of three

to fifteen hours, and in a majority of instances after nine hours.

Chancres and mucous patches healed and macular eruptions disappeared usually by the time treatment was finished. However, exceptionally large and deeply ulcerated chancres and heavily infiltrated papular eruptions required a longer time for complete healing. In every case the lesions healed without additional treatment, and no evidence of treatment resistance was encountered. The patient with syphilitic iritis and the one with syphilitic periostitis of the tibiae both responded rapidly and completely to treatment.

Treatment often had a provocative effect on the serologic tests for syphilis. Immediately after the termination of treatment, 9 of the 19 seronegative primary cases showed a positive serologic test for syphilis, and most of the seropositive primary and secondary cases showed an increase in the titer of the Kahn test.

Reversal of the serologic tests to negative was the end result of a gradual decline in the titer of the quantitative test during the post-treatment period. The accompanying chart demonstrates the provocative effect of treatment on the serologic tests and also the pattern of serologic decline to negativity in typical cases of seronegative primary, seropositive primary and secondary syphilis. In general, the speed of seroreversal depended on the initial titer of the Kahn test; that is,

TABLE 2.—Blood Serologic Response and Relapses in Seronegative Primary Syphilis

12-18.....	11	10	0	0	0
Over 18.....	4	4	0	0	0
Total.....	19	14	0	0	1

cases with a high initial titer required a longer time to achieve seronegativity than cases with a low initial titer. In the majority, complete reversal of the tests took place within four months following treatment. There were a number of exceptions, especially in secondary syphilis, with high initial titers, in which fixed seronegativity was attained only after a lapse of six to twelve months. In these cases the serologic reactions fluctuated in a narrow zone between negative, doubtful and positive reactions of low titer before a stationary negative state was maintained.

The 2 men who also had acute gonococcal urethritis obtained a complete cure of this infection. There was no apparent therapeutic effect on the lymphadenitis of lymphogranuloma venereum. The lymph nodes suppurated and discharged purulent material and did not heal until the sulfonamide drugs were administered.

RELAPSES

In table 1 are presented the details of 8 cases classified as relapses. Seven occurred in patients with secondary syphilis, and 1 in a patient with seronegative primary syphilis. In 5 patients there was a reappearance of lesions of the skin or mucous membranes, and in 4 of these treponemes were demonstrated in the lesions. All 5 patients also had a concomitant serologic relapse. Another patient suffered only a serologic relapse, but reexamination of his cerebrospinal fluid, which had been normal prior to treatment, showed it to be abnormal. The 2 other patients had a neurologic relapse, accom-

panied by serologic relapse and abnormal cerebrospinal fluid; 1 of these men had acute syphilitic meningitis, the other a monoplegia, and both had had normal cerebrospinal fluid before treatment.

In 6 patients the relapse was noted approximately 103 to 123 days after the inception of treatment, that

TABLE 3—Blood Serologic Response and Relapses in Seropositive Primary Syphilis

is, in the fourth month of observation. These included the 2 patients with neurologic relapse, the 1 with serologic relapse and abnormal spinal fluid, and 3 with cutaneous or mucocutaneous relapse. In none of these 6 cases could any serious consideration be given to the question of reinfection, but the other 2 cases (88 and 69) are controversial in this respect and merit special attention.

In case 88 negative serologic tests for syphilis occurred at 106 days after treatment and again at 120, 151, 181 and 213 days. At 207 days the cerebrospinal fluid was normal. At 243 days the titer of the Kahn test rose to 200 units and the patient was returned from another station for study. He had had an attack of acute gonococcal urethritis about two months previously, that is at about 183 days after treatment, and at that time the serologic tests were negative. The urethritis had responded to treatment with the sulfonamide drugs. Examination revealed a generalized lymphadenopathy and a papule of the scrotum in which *Treponema pallidum* was present. No evidence of a new chancre or of activity at the site of the former chancre was observed.

Patient 69 remained seronegative throughout treatment and up until 123 days following treatment, at which time he was lost from observation because of discharge from the army. Information was later received that this man had been admitted to a civilian hospital on May 19, 1945, about thirteen months after treatment, because of the presence of several penile erosions in

between twelve and fifteen months, 5 between fifteen and eighteen months, and 4 between eighteen and twenty-one months. One case (69) was classified as a relapse, and the facts have been detailed under the subject of relapses.

Table 3 presents the results in 34 patients with seropositive primary syphilis. The last serologic test was negative in 32 of these patients, at the following intervals after treatment: 1 in less than three months, 1 between three and six months, 1 between nine and twelve months, 14 between twelve and fifteen months, nine between fifteen and eighteen months and 6 between eighteen and twenty-one months. One patient had a doubtful Kahn test between twelve and fifteen months. One patient had a positive Kahn test, with a titer of 20 units as compared with a pretreatment titer of 200 units, between three and six months after treatment. No relapses have thus far been observed in this group.

Table 4 presents the results in 43 patients with secondary syphilis. The last serologic test was negative in

* Of the 11 abnormal fluids, 8 were normal on reexamination and 3 have not yet been reexamined.

† The 3 abnormal fluids were found in patients who suffered a clinical or serologic relapse and whose fluid was normal prior to treatment.

32 patients at the following intervals after treatment: 4 between six and nine months, 1 between nine and twelve months, 6 between twelve and fifteen months, 14 between fifteen and eighteen months, and 7 between eighteen and twenty-one months. Two patients had doubtful Kahn tests when last seen, 1 in less than three months and 1 between three and six months. A positive Kahn test was present in 1 patient between three and six months and in another between six and nine months, but in both cases the titer was considerably lower than that found prior to treatment. Seven relapses were observed in this group, and these have been explained in the preceding section under relapses.

Table 5 is a summation of the therapeutic results in the entire series. Twelve patients were observed less than six months, and of these 6 relapsed; of the other 6, 2 were seronegative, 2 seropositive and 2 had a doubtful Kahn test when last seen. Twelve more patients were observed between six and twelve months; in this group there was 1 relapse, and 10 were seronegative and 1 seropositive at the last examination. Among the 72 patients observed longer than twelve months there was 1 relapse; 70 were seronegative and 1 had a doubtful Kahn test when last examined.

which treponemes were demonstrated. On May 21, 1945 the Kahn test of the blood was positive (20 units) and the cerebrospinal fluid was normal. No exact information was obtainable as to the location of the new lesions in relation to the original chancre.

LATE EFFECTS OF TREATMENT

Table 2 presents the results in 19 patients with seronegative primary syphilis. Of these, 18 were seronegative when last examined, 2 between six and nine months after treatment, 2 between nine and twelve months, 5

CEREBROSPINAL FLUID EXAMINATIONS

Eleven of the 96 patients had an abnormal spinal fluid prior to treatment, as shown in table 6. In 6 patients the abnormality consisted solely of an increased cell count, between 9 and 14 cells per cubic millimeter, and in the other 5 there was a positive complement fixation reaction. Eight of these patients (5 with pleocytosis and 3 with positive complement fixation reaction) had a normal cerebrospinal fluid between 179 and 472 days after the onset of treatment. The other 3 patients have not as yet had a reexamination of the fluid.

The only abnormal cerebrospinal fluids among the 89 examined subsequent to treatment were found in 3 patients who suffered a relapse in the fourth month of observation; these have already been described in the section on relapses.

COMMENT

In both intensive penicillin therapy³ and intensive arsenotherapy⁴ it has been shown that immediate satisfactory response, as indicated by disappearance of treponemes, healing of lesions and reversal of serologic tests, is no criterion of ultimate satisfactory outcome. Grossly inadequate doses of the treponemicides produce immediate results similar to those obtained with therapeutically adequate doses. The effectiveness of a given treatment schedule must be judged by the incidence of relapse, which is greatest in the first six months after treatment, and by prolonged observation of patients to make certain that early satisfactory progress is maintained permanently.

Six of the eight relapses in the present series occurred in the fourth month of observation and were undeniably relapses rather than reinfections. Patient 88 (secondary syphilis) relapsed about eight months after treatment, and patient 69 (seronegative primary syphilis) about thirteen months after treatment. Both these men admitted frequent opportunity for reinfection, both had been seronegative for some time, and both had a normal cerebrospinal fluid on reexamination. Since the rigid criteria for reinfection could not be met, these cases are considered relapses in the present discussion. It follows, then, that the incidence of observed relapse in the present series of 96 patients was 8.3 per cent. Furthermore, it is significant that the incidence of relapse, by stage of disease, was as follows: in seronegative primary syphilis, only 1 (5.3 per cent) of 19 patients; in seropositive primary syphilis, none of 34 patients; and, in secondary syphilis, 7 (16.3 per cent) of 43 patients.

The patients followed for a period longer than twelve months and up to twenty months present a most reassuring serologic and clinical picture. Among 72 such patients (table 5) 70 were seronegative and 1 had a doubtful Kahn test when last examined. Of the eight relapses in the entire series, only 1 occurred after twelve months, and this patient (69) may have had a reinfection. The cerebrospinal fluid was normal in all 72 patients after treatment. Large accumulated experience with intensive arsenotherapy has revealed not only that the highest incidence of relapse occurs in the first six months following treatment, but that patients who are clinically and serologically well after twelve months of observation seldom suffer a relapse at a later period. Since the pattern of therapeutic response to intensive penicillin therapy in early syphilis is practically identical

with that of intensive arsenotherapy, it is probable that the 71 patients in this series who are progressing satisfactorily after twelve months of observation will continue to do so.

The beneficial effect of the treatment on abnormal cerebrospinal fluid is shown in table 6. The only abnormal fluids among the 89 reexamined were found in 3 patients who developed a serologic or clinical relapse in the fourth month of observation. Furthermore, in 8 patients with abnormal fluids prior to treatment all were normal when examined six months or more after treatment.

The incidence of observed relapse, 1 in 53 patients with seronegative and seropositive primary syphilis, and 7 in 43 patients with secondary syphilis, suggests that the treatment was adequate for primary syphilis but inadequate for secondary syphilis. Experiences with smaller doses of penicillin⁵ and with intensive arsenotherapy⁴ have been similar in this respect; a higher failure rate was generally found in the secondary stage of syphilis than in the primary stage. It is possible that the results in secondary syphilis can be improved by increasing the size of the individual dose of penicillin, by lengthening the course of treatment or by both. Certain unknown factors, such as the *in vivo* sensitivity of *Treponema pallidum* and the exact nature of the increased resistance to treatment of secondary syphilis, make it impossible to predict which of these possibilities is most likely to increase the percentage of cures. It is known, for example, that the height of the blood level can be doubled by doubling the size of the individual dose;⁶ however, this may be of no great advantage since doubling the blood level increases the duration of penicillin in the blood by only about one third. On the other hand, it may be that a higher level will give greater penetration into relatively inaccessible areas. It is obvious that the answer can be obtained only empirically—by treating large numbers of patients with different regimens.⁶ As a departure the armed forces and certain civilian agencies are now following the exact treatment schedule used in the present study but are doubling the size of each individual dose; i. e., 2,400,000 units in sixty injections. It may be found necessary later to prolong the duration of therapy, although from the standpoint of time and expense this is naturally undesirable.

While the treatment of early syphilis by the schedule described is totally inapplicable to the outpatient clinic, it has two enormous virtues: it assures complete treatment of practically all, if not all, patients, a goal never even approached by the outpatient, arsenotherapeutic clinic, in which a high percentage of the patients became discouraged and stopped treatment before it was completed; and it does this without significant toxicity. Perhaps the desideratum of a practicable and successful ambulatory therapy for early syphilis will be met by the use of penicillin suspended in beeswax-peanut oil mixtures,⁷ by administering one or two intramuscular or subcutaneous⁸ injections daily for eight or ten consecutive days.

SUMMARY

1. Each of 96 patients with early syphilis received sixty intramuscular injections of 20,000 units of penicillin in saline solution at three hour intervals, day and night, for seven and one-half days.

2. A Herxheimer reaction occurred in 88 (91.6 per cent) of the patients, and also some minor cutaneous, gastrointestinal and febrile reactions: in no case was it necessary to suspend or interrupt treatment because of reactions.

3. A relapse was observed in 8 (8.3 per cent) of the 96 patients, but 2 of these may have been reinfection. Relapse occurred in 1 (5.3 per cent) of 19 seronegative primary cases, in none of 34 seropositive primary cases and in 7 (16.3 per cent) of 43 secondary cases.

4. Of 72 patients followed from twelve to twenty months, 70 were seronegative and 1 had a doubtful Kahn test of the blood at the last visit; the other patient relapsed in the thirteenth month, and he may have had a reinfection.

5. The cerebrospinal fluid of 89 patients was reexamined six months or later following treatment; it was normal in 86, including 8 with abnormal pretreatment fluids: the 3 abnormal fluids were coincidental with a clinical or serologic relapse three to four months after treatment.

6. Although the results of this study must be considered preliminary—and the optimum treatment schedule, particularly for secondary syphilis, is still to be worked out—the findings suggest that the eight day treatment of early syphilis with 1,200,000 units of penicillin does cure early syphilis.

AN EFFECTIVE METHOD FOR THE CONTROL OF TRICHINOSIS IN THE UNITED STATES

S. E. GOULD, M.D.

ELOISE, MICH.

INCIDENCE OF TRICHINOSIS IN THE UNITED STATES

A large number of recent surveys of necropsy material in various localities in the United States has shown an average incidence of 16 per cent of trichinous infection.¹ When the methods of study were more thorough, an incidence as high as 36 per cent has been found.² The amazingly high frequency of parasitism with *Trichinella spiralis* revealed by these surveys caused Hall³ to emphasize that "the United States has the greatest problem of trichinosis of any country in the world."

It is now generally recognized that man acquires trichinosis primarily from eating trichinous pork and that the hog becomes infected primarily from eating scraps of uncooked trichinous pork present in garbage. The average incidence of trichinosis among hogs in the United States during the past fifty years has remained practically unchanged at a level of approximately 1.5 per cent. During 1944, 96,849,000 hogs were slaughtered in the United States and the total production of

pork was 12,893,000,000 pounds.⁴ It is estimated that this amount of pork would furnish about 30 billion individual servings, or approximately 200 servings per person in the United States. Since 1.5 per cent of the hogs are trichinous, 3 of these 200 servings of pork would contain trichinae. During 1944 most of the pork produced in this country was purchased by the armed forces and other governmental agencies for export. However, if it is assumed that in times of peace the annual per capita consumption of pork in the United States amounts to 200 servings, then each American consumes, on the average, 3 servings of trichinous pork each year; and since the average length of life of Americans is now over 64 years,⁵ there will be consumed for each American during his lifetime nearly 200 meals of pork containing trichinae. If the ingested trichinae are nonviable or have been killed by proper cooking or other method of processing, no infection will result. But it must be remembered that it requires the ingestion of viable trichinae in raw, undercooked or inadequately processed pork from only one meal to produce infection.

MORBIDITY AND MORTALITY FROM TRICHINOSIS

While it is true that in the vast majority of instances of parasitism with trichinae the infection is subclinical, there is no doubt that many infections produce symptoms which are undiagnosed. Gastrointestinal symptoms often appear three to fourteen or more days after the ingestion of trichinous pork, but the cause of this enteritis is seldom diagnosed or even suspected unless the patient becomes so ill as to require hospitalization or the disease occurs simultaneously in a number of persons. Considering the large chance for most people in the United States of eating pork containing viable trichinae at least once during their lifetime, it is not surprising that at least 16 per cent of Americans are found at autopsy to have been infected with trichinae. The morbidity rate in the United States is not definitely known, but the mortality rate in cases of clinically recognized trichinosis is 5 to 6 per cent.

TRICHINOSIS UNCONTROLLED AT PRESENT

The United States is in much the same situation today as regards the control of trichinosis as it was thirty or more years ago with regard to the question of pasteurization of milk. Despite the opposition at that time to the general adoption of pasteurization, the introduction of this method ushered in a new era in dairy sanitation. While there is considerable expense connected with pasteurization of milk, particularly for equipment, buildings and personnel, no one will now deny that the expense incident to effective pasteurization is worth while and even necessary for the protection of human health. And the public gladly assumes this extra expense in order to be assured of milk that is safe for human consumption. Prior to the general acceptance of pasteurization, many people were loath to drink milk, which they knew was often filthy; but today, when nearly all milk is pasteurized and produced under more sanitary conditions, the prejudice against drinking milk has practically disappeared. The dairy industry has profited vastly from the many advantages that it has gained as a result of the adoption of pasteurization of milk.

On the other hand, during the past fifty years very little progress has been made in the control of trichinosis in the United States. Approximately 70 per cent of American pork is prepared in plants which are under governmental inspection and carries the stamp "U. S. inspected and passed." This label on nonprocessed pork does not indicate that the meat is free from living

Fig. 1.—Adult gravid female trichina recovered from intestinal lumen of white rat six days after ingestion of trichinous meat. The female worm gives birth to from 1,000 to 1,500 trichina larvae. Slightly reduced from a photomicrograph with a magnification of 100 diameters.

trichinae. Meat-packing plants which are under governmental inspection are required to observe federal regulations for the processing of pork products of a kind ordinarily eaten without cooking, and such processed products may be expected to be free from viable trichinae. Other nonprocessed pork prepared in plants under federal inspection, and all pork prepared in plants not under federal inspection, may contain viable trichinae and may cause illness or death if consumed after inadequate cooking. The danger of contracting trichinosis from eating sausages containing pork is particularly great, since sausages are frequently eaten raw or insufficiently cooked.

Since only about 70 per cent of the pork is produced in plants under federal inspection and since in such plants it is only the processed products that may be expected to be free from viable trichinae, the larger part of the total American pork supply which reaches the kitchen is open to the danger of carrying live parasites. The consumer assumes that the pork that he eats is a safe food, but he is seldom aware that it is actually free from living trichinae. Furthermore, the consumer may knowingly or unknowingly eat pork that has been placed in certain meat products, such as frankfurters, hamburger, sausages, meat loaf and chop suey, which he purchases either in the butcher shop or the delicatessen store or in the restaurant, and if such meat products have been insufficiently cooked or inadequately processed he may run the risk of acquiring trichinosis. The question may properly be asked, "Why should the consumer of pork constantly be exposed to the danger to health and life from trichinosis?" Surely the public will be grateful for any method which will adequately safeguard its health in the consumption of this important

food, and it will gladly assume the small extra expense incurred in the production of a safe supply of pork.

In recent years numerous legal suits have been instituted because of illness or death resulting from trichinosis. The claims have been based, in most of these instances, on a breach of implied warranty of the fitness of the pork as a food for human consumption and in many cases on negligence in the methods of production of pork as a food. Most of the claims have been brought against the packer, and in the majority of suits the judgment has been rendered in favor of the plaintiff. In a number of instances the awards granted have been remarkably high.

The adoption of a method which will produce a supply of pork free from viable trichinae will remove the objection which many people now have to eating pork because of the danger of contracting trichinosis. After a method of control of trichinosis has been adopted, it is probable that other measures will be instituted for the improvement of sanitary conditions in the swine industry, so that the public will be less inclined to associate conditions of filth with the raising of hogs. From a purely business point of view, the swine raisers and the pork packers will surely benefit greatly from utilizing a satisfactory means for the control of trichinosis.

It is logical and inevitable that sooner or later a method will be adopted for producing a supply of pork that is free from the danger of causing trichinosis in man. The prevention of trichinosis in man consists essentially in the elimination of the disease from hogs. The high average incidence of approximately 1.5 per cent of trichinosis in hogs in the United States, which has remained unchanged during the past fifty years, stands in sharp contrast to an incidence of trichinous infection in hogs in Canada of 0.57 per cent, in Poland

Fig. 2.—Portions of gravid female adult trichina embedded in mucosa of duodenum of white rat six days after ingestion of trichinous meat. The mother worm is depositing her larvae at this point, from which they will eventually reach the skeletal muscle and encyst in it. Reduced from a photomicrograph with a magnification of 100 diameters.

of 0.05 per cent, in Germany of 0.001 per cent and in Copenhagen of only 0.00075 per cent. Official statistics are available covering the microscopic examination for trichinae in 8,000,000 hogs in the United States from 1898 to 1906 and in 6,000,000 hogs in Copenhagen from 1910 to 1935. These statistics show that in the United

States over 14,000 hogs per million were found trichinous, compared to only 7 hogs per million in Copenhagen.

AVAILABLE CONTROL MEASURES

Measures which have been advocated in the control of trichinosis include (1) destruction of rats, (2) elimination of garbage and of offal from the feed of hogs,

Fig. 3.—Encysting larvae in human muscle. Infection about 7 weeks of age. Note intense inflammatory reaction. Reduced from a photomicrograph with a magnification of 75 diameters.

(3) cooking of garbage which is to be fed to hogs, (4) microscopic inspection of pork, (5) proper processing of pork products which are customarily eaten without cooking and (6) education of the public in the necessity of adequate cooking of pork and pork products which are customarily cooked before being eaten. Skin-testing of hogs with a trichina antigen prior to slaughter, as a possible method of control,⁶ has been found to be unreliable in detecting animals which harbor trichinae.

While rats are frequently infected with trichinae, it is generally agreed that it is a very rare occurrence for a pig to eat a rat and therefore for a pig to acquire trichinosis from a rat. It is, of course, highly desirable from the point of view of general sanitation that methods be instituted for the extermination of rats, but it must be admitted that the rat plays a minor role in the spread of trichinosis to the pig and thence to man.

Education of the public through the medium of the newspapers, by use of posters displayed in butcher shops and particularly through instruction in the public schools should not be neglected, but such education in itself will not eradicate trichinosis in man or pig.

There are three principal methods of control of trichinosis: (a) microscopic inspection of pork, (b) cooking of all garbage fed to hogs and (c) processing of all pork prior to its ultimate sale.

MICROSCOPIC INSPECTION

The microscopic inspection of pork has been practiced in a number of countries and has proved to be quite effective. This is the method which has been

used most extensively in various parts of Germany since 1865. During the years 1883 to 1924 in the city of Berlin 4,337 hogs were found to be trichinous, and during these forty-one years no case of human trichinosis was reported in that city from eating pork that passed inspection. In other parts of Germany trichinosis from eating raw pork which had passed microscopic inspection has been reported sporadically, and yet there can be no question but that in Germany the systematic enforcement of this method has almost eradicated the disease. Other countries which require microscopic inspection of pork for trichinae include Denmark, Sweden, France, Argentina and Chile. The United States also had compulsory microscopic inspection of pork during the period from 1891 to 1906, but only for pork that was intended for export. This inspection was authorized by an act of Congress and was necessitated by the virtual exclusion of American pork from the European market, an embargo which was highlighted by specific decrees issued by Bismarck in 1880 and 1883 which prohibited the importation of American pork into Germany. Despite the method of microscopic inspection which was instituted in the United States in 1891, Germany in 1892 required the reinspection of American pork and in 1898 refused altogether to accept the certification of inspection of the United States Department of Agriculture. Consequently in 1906 Congress adopted a new measure which no longer required that pork be inspected microscopically.

Microscopic inspection has therefore never been applied in the United States to pork consumed in this country. A theoretical objection has been raised that this method is not practical, since it is too time consuming for present high-speed American requirements. Microscopic inspection has recently been introduced into Chile, where the use of the phototrichinoscope has been found to expedite the examination. By this method a moving trichinoscope or compressor containing several specimens of meat from each hog is projected onto a screen, where it is scrutinized by the inspector for the possible presence of trichinae. If the method of microscopic inspection should be instituted in the United States for the control of trichinosis, it is safe to assume that suitable devices for a sufficiently rapid examination of the meat would soon be developed.

The method has also been criticized as being too expensive. It is true that the expense of the microscopic inspection would undoubtedly be greater than either of the other methods of control under consideration, since it would require, in addition to buildings and apparatus, a vast corps of inspectors. The relatively greater cost of microscopic inspection, therefore, constitutes a disadvantage of this method. But even more important than the cost of the method is the relative degree of its effectiveness. In addition to the relatively greater cost, there are two other serious objections to microscopic inspection which arise from defects inherent in the method. Specimens of pork containing trichinae may pass inspection undetected. This is particularly possible in meat containing young unencysted larvae or larvae enclosed within noncalcified cysts, since the larvae and the uncalcified cysts both are more or less transparent and therefore often difficult to recognize. The age of the vast majority of hogs which now come to slaughter in this country is less than a year, and at this age calcification of the trichina cysts is almost never present. Another valid objection lies in the large possibility that the particular specimen of

6. Schwartz, B.: Trichinosis in Swine and Its Relationship to Public Health, Ann. Rep. Smithsonian Inst. (1939), 1940, pp. 413-435.

meat examined may be free from trichinae, while the larvae are abundantly present in other portions of unexamined meat from the same animal. Thornbury⁷ investigated hogs for the presence of trichinae in the diaphragm and muscles of the neck and loin. Among 1,043 hogs that were found trichinous the diaphragm was involved most often and most heavily, and yet no trichinae were found in the diaphragm in 24 per cent of these trichinous hogs. A fourth objection to the use of microscopic inspection is that the public may gain a false sense of security in assuming that pork which has passed inspection is safe for consumption in the raw state.

FEEDING OF COOKED GARBAGE TO HOGS

The second plan of control of trichinosis, that of cooking garbage which is to be fed to hogs, is one which has been adopted in Canada, England, the Hawaiian Islands and the states of Kentucky, Oregon and New York. This method has been repeatedly advocated by Hall³ and by Wright.⁸ The cost of instituting the method and providing apparatus for the cooking of garbage which is to be fed to hogs need not concern us. The points of fundamental importance are the effectiveness and the practicability of such a plan in the control of trichinosis. If all garbage was to be cooked prior to feeding it to hogs, the incidence of trichinosis among hogs so fed would be greatly decreased. However, it must be remembered that even among grain-fed hogs approximately 0.9 per cent of the animals are trichinous⁹ and that the method under discussion would not eliminate the infection in grain-fed hogs. The method of feeding cooked garbage to hogs could undoubtedly be enforced in the case of large swine raisers, but it appears practically impossible to enforce the law in the case of small swine raisers. This fact alone makes the method, from a practical point of view, unworkable. In the states of New York, Oregon and Kentucky difficulties of enforcement have rendered the law ineffective. Furthermore, in the state of Oregon a person is permitted to feed swine garbage which has accumulated from his own household. In Chile, where the principal method of control is microscopic inspection, the law wisely forbids the feeding of any garbage, cooked or uncooked, to hogs.

The successful operation of this method of control would require a huge corps of sanitary inspectors and a tremendous job of policing. The method is regarded as less practical than microscopic inspection.

PROCESSING OF PORK

The third possible method of control is that of processing pork and pork products. By processing is meant the treatment by methods of freezing, cooking, smoking, curing or other means, according to federal specifications, which will render nonviable any trichinae present in meat. It is proposed that the federal government enact legislation which will require all pork that is intended for interstate shipment to be so processed as to render it free from living trichinae; furthermore, that all pork, pork products or meat preparations containing pork be required to bear the following label: "This product conforms to U. S. specifications for

processing of pork." Likewise it is proposed that all city, county or state health authorities adopt similar regulations governing the preparation of all pork which is intended for local sale within the city, county or state, and that all such pork shall be labeled "This product conforms to (local) health regulations for processing of pork."

Trichinae are killed at a temperature of 55 C., but the federal regulations require that in killing trichinae by heat all parts of the meat shall be raised to a temperature of 58.33 C. (137 F.). In the case of fresh pork, processing consists principally in the methods of freezing. Trichinous meat in sections of 6 inches or less can be rendered noninfective by refrigeration¹⁰ at a temperature of 5 F. for twenty days, minus 10 F. for ten days or minus 20 F. for six days. It has also been found¹¹ that raw pork in commercial quantities may be rendered free of infective trichinae by lowering its temperature to minus 35 C. (minus 31 F.) or by freezing¹² at minus 17.8 C. (0 F.) for seventy-two hours. In ground meat, encysted trichinae are killed within a few minutes at a temperature of minus 17.8 C. (0 F.). In most deep-freeze cabinets, such as those used in the home, temperatures varying from 0 to 5 F. are usually maintained. The main costs connected with this method of control of trichinosis are the costs of apparatus, such as refrigerating units, and of storage space. These expenses are initial ones, and similar initial expenses would be found necessary in any other method. The operation or maintenance of the method, however, would involve relatively little personnel as compared with microscopic inspection, and the method of processing therefore would be much cheaper. In the last analysis the cost of this method would not be great and would, of course, be borne by the consumer. The consumer would, in fact, be glad to assume this extra cost if he could have the assurance that he was receiving meat that was free from living trichinae.

The method of processing pork would largely eliminate trichinosis from hogs very quickly and would at the same time check the spread of trichinosis to man. If in any one year all pork should be processed, all trichinous pork would contain only nonviable trichinae, and any scraps of such pork which might reach the new crop of hogs would be incapable of producing trichinosis in them. Butcher hogs that come to market average from 9 to 10 months of age, sows average from 20 to 24 months, and the overall average age of hogs at the time of slaughter is about 11 months.⁴ It is logical, therefore, to expect a rapid decrease in the incidence of trichinosis in hogs within a very few years after the general introduction of such a method of control. The hog raiser and the packer would benefit greatly from the advantages which would accrue to them in being enabled to supply to the public pork which was free from its chief stigma, the danger of trichinosis.

The initiative for such a method of control appears, from past indications, to rest primarily on physicians and public health authorities. The time will surely come when the public will insist that the pork which it eats, no less than the milk which it drinks, is safe for human consumption.

Clinical Notes, Suggestions and New Instruments

ACCIDENTAL INTRA-ARTERIAL INJECTION OF OXOPHENARSINE HYDROCHLORIDE (MAPHARSEN)

MAJOR EDMUND N. WALSH AND CAPTAIN J. LANIER WYATT
MEDICAL CORPS, ARMY OF THE UNITED STATES

No reference to the effects of the intra-arterial injection of oxophenarsine hydrochloride (mapharsen) was found in the textbooks and literature available. Stokes¹ implied that arsphenamine may be safely injected intra-arterially but did not mention that there may be reactions from the other arsenicals. The painful reaction described here is believed to have followed such an accidental injection.

A brown Panamanian aged 22 was under treatment for early latent syphilis at the Venereal Disease Clinic of Gorgas Hospital, Ancon, C. Z. Both the Wassermann and Kahn reactions of the blood serum were strongly positive, but there was no other clinical or laboratory evidence of disease. The reaction followed his twelfth injection of oxophenarsine hydrochloride.

On the regular weekly clinic visit, a routine check-up serologic test and 0.05 Gm. of oxophenarsine hydrochloride were ordered. The nurse injector, using a 22 gage needle and a 10 cc. syringe, withdrew a 4 cc. blood specimen from a vessel in the left antecubital fossa. Releasing the tourniquet, but leaving the needle in place, she detached the syringe containing the blood sample, attached a second syringe containing the 0.05 Gm. of oxophenarsine hydrochloride in 8.6 cc. of distilled water and injected the drug in approximately ten seconds.

Before completion of the injection, the patient complained of pain in the hand and lower part of the forearm. Within a few seconds after the withdrawal of the needle the pain had increased to such an extent that he was groaning, his face became pale and he seemed about to faint. It was necessary to assist him to a bed in the clinic. Morphine sulfate 0.015 Gm. was given for the pain about five minutes after the injection. One half hour later the patient was still moaning with pain, and he was transferred to a hospital ward, where another 0.015 Gm. of morphine was given.

When seen by one of us (J. L. W.) about one minute after the injection, the skin of the forearm and hand was bluish. This dusky color faded in a few minutes and the skin of the hand became slightly pinker than normal. The pain was described as a steady boring or aching pain and not as burning or cramplike. It was generalized in the forearm and hand but was most severe in the thenar and hypothenar eminences and in the finger tips. These areas were slightly tender to touch. Motion and tactile sensation were unimpaired. Local applications of heat or cold did not relieve the pain.

Two hours later the pain was considerably less. The skin color and pulse were normal, but the forearm and hand were slightly swollen as compared to the opposite extremity. Five hours after the injection the oral temperature was 99.2 F. and slight swelling was still present but there were no other changes. The following day the patient had no complaints and was discharged from the hospital. He has been followed in the clinic for one year without developing sequelae and has received subsequent injections of oxophenarsine hydrochloride without difficulty.

We believe that the reaction was due to an intra-arterial injection of oxophenarsine hydrochloride for the following reasons:

1. The color of the blood specimen drawn from the patient was a much brighter red (arterial) than the specimens drawn from other patients at about the same time. This difference was still noticeable when we examined the rack of blood specimens one and one half hours later.

2. The pain began immediately and occurred only distal to the site of the injection. There was no pain in the upper arm as with venous spasm. There was no swelling or pain at the injection site suggesting an infiltration.

3. The pain was generalized in the forearm and hand and was not confined to an area corresponding to the distribution of a nerve.

4. On examination of the patient's antecubital fossa, a superficial pulsating vessel could be felt just beneath and parallel to the visible vein that the operator had intended to use.

The injector was relatively inexperienced, so that minor abnormalities in the injection procedure such as the resistance of the vessel wall, the ease with which the blood was withdrawn and the color of the blood may have been overlooked. The small size of the needle (22 gage) also tends to minimize the first two points. One possible explanation for the fact that blood did not spurt from the needle during the interval when the syringes were changed is that the bevel of the needle was in contact with the vessel wall.

In the two years that the clinic has been in operation, 60,000 intravenous arsenical injections have been given. During this time there has been one other similar but less severe reaction. Subsequent examination showed a superficial artery in the forearm of this patient also, but there was no other evidence to confirm the suspicion that the pain was due to an intra-arterial injection.

SUMMARY

A severely painful local reaction followed an injection of oxophenarsine hydrochloride. The pain lasted several hours and required morphine for relief. We believe it was due to an accidental intra-arterial injection because a blood specimen drawn just before the injection was bright red (arterial) blood, the pain was immediate and entirely distal to the point of injection and an anomalous superficial artery was found at the injection site. Except for the severe pain, there were no serious sequelae.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

PENICILLIN (See New and Nonofficial Remedies, 1945, p. 214).

The following additional dosage forms have been accepted:

MERCK & CO., INC., RAHWAY, N. J.

Penicillin Sodium: Vials containing 200,000 Oxford Units.

Penicillin Calcium: Vials containing 200,000 Oxford Units.

SULFADIAZINE (See New and Nonofficial Remedies, 1945, p. 185).

The following dosage form has been accepted:

VOGEL LABORATORIES, MOHEGAN LAKE, N. Y.

Emulsion Sulfadiazine 5% Sterilized: 50 cc. and 200 cc. bottles. A 5 per cent suspension of sulfadiazine in an emulsion of beeswax, liquid petrolatum, triethanolamine and water.

DIPHENYLHYDANTOIN SODIUM (See New and Nonofficial Remedies, 1945, p. 528).

The following dosage form has been accepted:

PREMO PHARMACEUTICAL LABORATORIES, INC., NEW YORK

Capsules Diphenylhydantoin Sodium: 0.03 Gm. and 0.1 Gm.

THEOPHYLLINE ETHYLENEDIAMINE (See New and Nonofficial Remedies, 1945, p. 388).

The following additional dosage form has been accepted:

ERNST BISCHOFF COMPANY, INC., IVORYTON, CONN.

Solution Aminophylline: Ampuls 0.24 Gm. in 10 cc. and 0.48 Gm. in 2 cc.

From the Branch Medical Clinic, Gorgas Hospital, Ancon, Canal Zone.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report.

HOWARD A. CARTER, Secretary.

SAFETY OF MODERN ALTERNATING POSITIVE AND NEGATIVE PRES- SURE RESUSCITATORS

HENRY SCHWERMA, PH.D.

AND

A. C. IVY, PH.D., M.D.

This investigation was undertaken primarily to ascertain whether one of the currently used positive and negative pressure resuscitators (so-called "suck and blow" type) when used for one to three hours will cause a significant amount of damage to the lung. The experimental conditions were such that we had the opportunity of observing whether the use of the resuscitator interfered with the return of a low blood pressure to normal as compared to intermittent positive pressure devices.

The subject requires investigation because resuscitators of the "suck and blow" type are being quite widely used in the United States¹ and because the wisdom of their use, particularly by laymen, has been questioned.² It is appropriate to examine the literature to ascertain the evidence on which the questionable use of the "suck and blow" resuscitator is based.

ANALYSIS OF THE LITERATURE

Henderson and Turner³ state that "the deaths resulting from suck and blow respiration applied to dogs in the experiments of Henderson and Haggard,⁴ of Henderson⁵ and of Coryllos⁶ deserve serious consideration." The reference to Henderson and Haggard⁴ refers to four experiments in which it was observed that excessive artificial respiration for a prolonged period decreases blood pressure, washes out carbon dioxide and causes apnea vera. The reference to Henderson⁵ refers to a number of experiments in which excessive artificial respiration for twenty-five to thirty minutes is followed by apnea so prolonged that the heart fails after seven or eight minutes for the lack of oxygen. However, in producing the hyperventilation the respiratory rate was 60 to 120 cycles per minute (the minute volume is not provided) with an alternating positive and negative pressure of 30 cm. of water. The reference to Coryllos⁶ refers to experiments on 7 dogs which were under amytal anesthesia and received artificial respiration for one to eight hours. Four of the 7 dogs died from five to twelve hours after the conclusion of the experiment and "at autopsy relatively slight pulmonary and other lesions were found, which could not explain death." "Suspecting chilling as a possible cause," the other dogs were kept warm, the gas inhaled was humidified and no deaths

occurred. Henderson⁷ in 1916 was inclined to doubt "whether an active withdrawal of air with a pump of limited stroke has any very serious objections" and referred to his hyperventilation experiments⁸ in which he used "two pumps arranged in a manner similar to the 'lungmotor' and worked quite violently" and which caused "no particular ill effects on the lungs." In the same paper he recommended that the "Pulmotor Model B" be equipped with blow off valves limiting the positive pressure to 15 cm. of water pressure and the negative pressure to 10 cm. Meltzer,⁹ who studied the old "Pulmotor," found that it would frequently turn off the supply of air when the pressure in the trachea was only 4 cm. of water. As a result the lungs were inadequately ventilated and decreased in volume with the chest open. He believed that the suction would favor collapse of the bronchioles and hence only the dead air space would be ventilated. He pointed out that Henderson's favorable view of "suck and blow" was due to the fact that the pumps he used were directly connected to the trachea, which would obviate the resistance in the nasopharynx. Meltzer⁹ used a device with bellows for intermittent positive pharyngeal insufflation with a tube in the stomach to release any gas entering it. In 1934 Henderson,¹⁰ in discussing intratracheal insufflation with intermittent positive pressure, recommended a maximum pressure of 40 mm. of mercury for the adult and 25 mm. for the infant. In discussing the E and J Resuscitator he stated that "pressure and suction require intubation of the trachea, an operation that properly and legally can be performed only by physicians. The administration of pressure and suction with a mask sometimes works; but it is liable to fail when most needed. In the hands of laymen, such apparatus cannot be made free from serious danger of injury to the lungs." Henderson and Turner³ in 1941 experimented with the E and J Resuscitator and gassed 6 dogs with carbon monoxide to the stage of coma, in which stage they were either convulsive or limp. The three treated with the E and J Resuscitator and 5 per cent carbogen (presumably 5 per cent carbon dioxide and 95 per cent oxygen; they do not state) died and the 3 treated with manual artificial respiration and carbogen survived. The lungs of the animals treated in these and other experiments were not examined. They found that, "in brief, a resuscitator is merely an inhalator which tends to impede natural breathing by sucking and blowing." They wrote however that, "in order to administer carbon dioxide efficiently, the pulmotor, E and J Resuscitator and similar devices should be modified to eliminate the suction phase, decrease the pressure of the blowing phase and greatly increase its volume. They would then become efficient resuscitation apparatus, which at present they are not." But we have been unable to find any reason given or evidence submitted by Henderson indicating why suction is undesirable.

We have been unable to find evidence in the publications of Henderson and his associates which indicates that the lung is damaged by alternating positive and negative pressure. The alternating positive and negative pressure of 30 cm. of water (22 mm. of mercury) used in his hyperventilation experiments may have been conducive to the fall in blood

pressure and fatal apnea that he observed¹¹ or the fall in blood pressure may have been due to anesthesia or to both. SeEVERS and his associates¹² observed that hyperventilation (P_H increase in plasma 0.31 unit) decreased the systolic pressure 10 mm. of mercury before and 25 mm. of mercury during anesthesia. Apnea occurred for five to nine minutes but was followed by a return of normal respiration and blood pressure. This evidence indicates that acapnia, though undesirable, is not as serious as the experiments of Henderson and Haggard indicate. However, it does constitute one of the arguments in favor of the use of carbogen in the treatment of carbon monoxide anoxemia, in which there is no pronounced accumulation of carbon dioxide in the body as occurs in obstructive asphyxia. As Henderson and Turner have shown, artificial respiration of the suck and blow type interferes with the rhythm of natural breathing. But any type of artificial respiration which is not synchronized with natural breathing will do the same. The evidence of Henderson and Turner regarding the comparison of the effectiveness of manual with mechanical artificial respiration, in which only 6 gassed dogs were used, is certainly inadequate. The results of such a comparison made by us on larger groups of dogs will be submitted in our subsequent report.

THE PRESSURE REQUIRED TO RUPTURE ALVEOLI

The amount of pressure required to rupture alveoli has been studied by several groups of investigators. Ewald and Kobert,¹³ using rabbits, found that air in the lungs under a pressure of 40 mm. of mercury (54.4 cm. of water) caused rupture of the alveoli and pneumoperitoneum. In 1931 Joannides and Tsoulos,¹⁴ using dogs, found that a continuous intrapulmonic pressure of 60 mm. would cause interstitial emphysema and that higher pressure would cause pneumothorax, pneumoperitoneum and air embolism. Polak and Adams¹⁵ placed a gas trap in the carotid artery of dogs and found that air appeared in the trap when the intrapulmonic pressure was 80 mm. of mercury (109 cm. of water) for ten second periods of inflation; it did not appear when the pressure was 60 mm. of mercury; 100 mm. of mercury caused extensive interstitial mediastinal and subcutaneous emphysema. Burkhardt and Ivy¹⁶ found that the presence of 100 mm. of mercury pressure of air in the trachea for two seconds will cause rupture of the pleura in some dogs as well as emphysema. Macklin¹⁷ has described anatomically the passage of air bubbles from the alveoli along the sheaths of the pulmonary vessels to the mediastinum when the lungs are overinflated. Coryllos,⁶ studying the isolated lung of dogs, observed the leakage of air when the continuous intrapulmonic pressure was 52 mm. of mercury.

More recently studies have been performed the results of which reveal the occurrence of interstitial and mediastinal emphysema with lower intrapulmonic pressures. These investigators were interested in the possible dangers of intratracheal anesthesia under the conditions

of thoracic surgery. Marcotte and his associates,¹⁸ using 11 dogs, introduced air as a continuous stream into the trachea through a catheter with an outflow. The intrabronchial pressure was maintained at pressures ranging from 16 to 110 mm. of mercury for eighteen to seventy-five minutes. A sustained pressure of 24 mm. of mercury (32.6 cm. of water) produced interstitial and mediastinal emphysema, but such a lesion was not obtained with 18 mm. of mercury until the chest was opened. Cats were more susceptible, developing emphysema with pressures of 16 to 20 mm. of mercury. Rasmussen and Adams¹⁹ conducted acute and chronic experiments on dogs to ascertain the effects of an intermittent type of positive pressure on the lungs. The on-period of the pressure in each cycle was three times longer than the off-period in order to simulate the longer expiratory pressure period present during an attack of asthma. The lungs were inflated twenty-eight times per minute with a pressure at the carina ranging from 30 to 35 mm. of mercury. The acute experiments varied from thirty-five to seventy-five minutes in duration. In the chronic experiments the lungs were inflated, with the animal under morphine anesthesia, for fifteen minutes twice a week for from one week to eleven months. Microscopically all the dogs had slight to pronounced interstitial emphysema. Two, or 22 per cent of the 9 dogs, died with mediastinal emphysema, air embolism and subpleural hemorrhage during the period of overinflation. During overinflation the arterial pressure was much reduced in the acute and cyanosis occurred in the chronic experiments.

It should be emphasized that in the foregoing experiments the pressures were intrabronchial and not oronasal and that they were relatively high and more or less continuous. Orth and his associates²⁰ found that the fall of pressure from a mask to the carina was from +34 mm. of mercury at the mask to +28 mm. of mercury at the carina when he used a resuscitator which gave the largest positive pressure at the mask. It would appear from the observations of Rasmussen and Adams and of Marcotte and his associates on the dog that the positive pressure at the mask should probably not exceed 20 mm. of mercury (27 cm. of water). If the device has a blow off valve set at a maximum of 20 mm. of mercury, any lack of synchronization with natural breathing when it appears unexpectedly will safeguard the lungs from undue pressure. It is assumed that, when natural breathing is adequate, artificial respiration will be stopped and the inhalator turned on.

INTRABRONCHIAL PRESSURE IN MAN UNDER ORDINARY CONDITIONS

Under ordinary breathing the intrabronchial pressure varies under +1 to +5 mm. of mercury to -1 to -3 mm. of mercury. During speaking with the ordinary pitch and loudness, the intratracheal pressure ranges from 10 mm. of mercury to 18 mm. of mercury. During shouting it may be as large as 70 mm. of mercury. For a second or more during coughing, the intratracheal pressure may be as high as 80 to 100 mm. of mercury.²¹ In the dog, during expiration with the

trachea obstructed, the pressure may be as high as +76 mm. of mercury and during inspiration as low as -35 mm. of mercury. This must be taken into account in interpreting the presence of interstitial and mediastinal emphysema and air embolism in obstructive asphyxia.

LACK OF EVIDENCE OF LUNG INJURY USING THE POSITIVE-NEGATIVE PRESSURE RESUSCITATOR

Relatively little work has been published in which the effect on the lungs of a resuscitator of the suck and blow type has been investigated.

Rost²² in 1932 used a suck and blow type of artificial respiration in which the peak positive and negative pressure was ± 14 mm. of mercury. The animal was anesthetized and curarized. No deleterious effects on the lung or blood pressure were observed in acute or recovery experiments. He observed no untoward effects when the technic was applied to the human being. The lungs were not examined for emphysema microscopically. Coryllos⁶ used the E and J Resuscitator, which provides a maximum positive pressure of 14 mm. of mercury and a negative of 9 mm. of mercury. He obtained favorable results with its use in human and canine tests. Of the 4 dogs which died, he reports only one microscopic study of the lungs and does not mention emphysema. In his other tests, if emphysema occurred it was not significant. Birnbaum and Thompson²³ in a series of studies summarized by Thompson²⁴ in 1944 used the Emerson Resuscitator, which is a suck and blow type (+14 mm. of mercury and -9 mm. of mercury). They chiefly studied resuscitation from obstructive asphyxia and anoxia due to the inhalation of inert gases, such as pure nitrogen. They resuscitated 72 of 106 animals. They did not study the lungs microscopically, but it was probably not necessary because they used the resuscitator only a few minutes. Steinberg and Dietz²⁵ used the McKesson resuscitator, which inflates and deflates the lungs by a fixed volume, on seven dogs for from one to eight hours. They do not provide the peak positive and negative pressures used. The microscopic study of the lungs in 2 of the animals showed no abnormalities except some hyperemia. More recently Drinker² has stated "I have never been afraid that blow and suck machines as safeguarded today would do harm by rupturing the lungs. Their failure is through lack of air delivery." In 1923 he and his associates²⁶ reported experiments on cats in which a lungmotor set at +20 mm. of mercury and -4 mm. of mercury did not embarrass the dilated heart in carbon monoxide poisoning and produced no evidence of rupture of the lung. They say that "the possibility that positive ventilation might rupture a diseased lung can never be dispelled by animal experimentation." In his latest paper Drinker² reports an experiment on a dog under anesthesia and curare in which a suck and blow apparatus was connected to a tracheal cannula. The positive pressure was 10 cm. of water and the negative 8 cm.; air was used. As a consequence he observed during a period of four hours a gradual decrease in lung volume. It is stated that "the loss is due to gradual atelectasis and

exudation in dependent parts of the lungs where expansion is most difficult. It occurs more rapidly in a machine which sucks during expiration than in one in which expiration is passive, as in normal breathing." This would seem to be reasonable under the condition of the experiment, but more evidence is needed to establish the latter statement. It may not apply when 5 or 7 per cent carbogen is used but may when oxygen is used; or it may apply only if the minute volume of respiration is kept constant by a tight fitting tracheal cannula. He interprets his observations as arguing against the prolonged use of the suck and blow method, especially in the presence of water or exudate in the air passages.

Thus, our review of the literature has revealed no evidence showing that lung damage occurs in the dog when continuous insufflation yielding an intrabronchial pressure of 18 mm. of mercury or less is used or when the modern suck and blow resuscitators with a peak of positive and negative pressure of +14 mm. of mercury and -9 mm. of mercury is used. The evidence, however, is meager.

DO RESUSCITATORS PREDISPOSE TO PNEUMONIA?

Another point in connection with lung damage deserves consideration: One would like to know whether the methods used for resuscitation vary in regard to the predisposition to subsequent pulmonary disease. If one method predisposes more to atelectasis and pulmonary edema than another, this might predispose to pneumonia. Or, if a method causes the passage of more material from the upper respiratory tract into the lungs, this might predispose to pneumonia. The first possibility is suggested by the aforementioned experiment of Drinker.² The second possibility was studied by Drinker and his associates²⁶ in 1923. In these experiments they compared the extent to which material dripped into the trachea of anesthetized animals is carried into the lungs under natural breathing and artificial respiration. They concluded from the experiments that "apparently, if one utilizes an air blast which is sufficiently vigorous to get air into the alveoli in anything like normal amounts, he is in danger of carrying in material from the upper respiratory tract." Experiments with manual artificial respiration were not conducted. It would seem that the only way to obtain evidence on this problem would be to asphyxiate animals, resuscitate some by manual respiration and others by a positive pressure method, and ascertain the incidence of pneumonia in the two groups.

IS A NEGATIVE PHASE IN THE RESPIRATORY CYCLE OF RESUSCITATORS ADVANTAGEOUS?

Though we have been unable to find evidence showing that intermittent positive-negative intrapulmonic resuscitators damage the lungs or interfere with the circulation, the question arises What are the advantages of adding the negative phase to the respiratory cycle, if any? Birnbaum and Thompson²⁷ presented evidence indicating that suction is beneficial for the reason that it stimulates inspiratory sensory fibers in the vagi. This is the only suggestion that has been made indicating that suction directly affects respiration other than that suction assists respiration in the presence of hypotonic muscles associated with feeble respiration or the absence of respiration. Comroe and Dripps,²⁸

however; suggest that "a moderate weight applied to the chest wall will probably serve as well without incurring the risks involved with suction." It might be rejoined that the "moderate weight" would increase the amount of positive pressure required and, it might be asked, What risks does —8 mm. of mercury of suction introduce when applied at a mask with an "airway" in position? Nevertheless, in our opinion, the observations of Thompson and Birnbaum call for confirmation.

Maloney²⁹ has suggested that expiration by suction removes noxious gases better than passive expiration. This would be difficult to prove unless the minute volume of respiration is carefully controlled.

Birnbaum and Thompson²⁷ suggest that resuscitators of the suck and blow type by "milking" blood from the lungs significantly improve the return of blood to the heart. This suggestion could not be substantiated by Volpitto, Woodbury and Abreu.³⁰ These investigators found that, "irrespective of the method of mechanical artificial respiration employed, recovery of the animal was accomplished when respiratory arrest and slow weak cardiac contractions were produced with helium" inhalation. They also found that the effect of the various mechanical methods on the pulmonic and systemic blood pressure was essentially the same.

While our work was in progress a paper by Orth and his colleagues²⁰ appeared in which they reported results on the effect of artificial respiration on the lungs. Using fewer animals than we have employed, they arrived at essentially the same conclusion, which is warranted by the results of our investigation. Their conclusion was as follows: "Pulmonary damage was present in control groups of animals either sacrificed and examined without any period of anesthesia or respiratory manipulations or subjected only to anesthesia in which respiration occurred spontaneously. Similar damage was evident in groups of animals subjected to various methods of artificial respiration."

THE EXPERIMENTAL DESIGN

Four series of experiments were performed. Series A consisted of 102 dogs which were used as a control series to ascertain the incidence of pulmonary disease in laboratory dogs as they were selected by us for this study during the late fall and winter months. Series B consisted of 25 dogs which were used to study pulmonary disease after use of the E and J Resuscitator for from one to three hours when the respiratory muscles were paralyzed with curare and the animals under anesthesia. Series C consisted of 5 dogs which were used to ascertain whether the use of the resuscitator in the presence of natural breathing would cause emphysema. Series D consisted of 22 dogs which were used to ascertain whether the use of other resuscitators damaged the lungs or interfered with blood pressure.

The dogs weighed 5 to 12 Kg. All were "clinically normal" as judged by appearance, behavior and the absence of the signs of distemper or other disease. X-ray films of the chest were not made because of the scarcity of x-ray film. Physical examination of the chest in the untrained dog is not satisfactory.

A. The Control Series.—One hundred and two dogs served as a control series; they were killed either by bleeding during pentobarbital anesthesia or at the end

of an experiment of two hours' duration under anesthesia with natural breathing. The lungs and trachea of these dogs were then examined grossly and all lesions were measured, described and recorded.

B. The Treated for Recovery Series.—Twenty-five dogs served as the "treated series." They were anesthetized with pentobarbital and the femoral artery was connected to an apparatus for recording blood pressure. Respiratory movements were recorded by means of a pneumograph held in place by a towel at the level of the xiphoid. The femoral vein was cannulated to facilitate the injection of curare along with 0.9 per cent solution of sodium chloride. In several of the earlier experiments a tape measure was fixed in place about the lower part of the chest to measure the excursion during natural breathing and later artificial respiration. In several of the earlier experiments the parietal pleura at the fifth interspace was exposed to observe the movement of the lungs during natural and artificial respiration through the parietal pleura without opening the thorax. Between observations this wound was snugly covered with gauze held in place beneath the skin with clips.

The artificial respiration was given through a mask of the type commonly employed for the study of oxygen consumption in unanesthetized dogs. The fit of the rubber diaphragm of the mask about the neck was such that leaks were absent or insignificant and did not interfere with the effectiveness of the artificial respiration. The positive and negative pressure in the mask was observed by a sensitive aneroid pressure gauge recording in $\frac{1}{4}$ inch of water pressure.

The E and J Resuscitator was used for artificial respiration. It is designed to provide a gas for inhalation (an inhalator) or a gas for positive and negative pressure artificial respiration. The maximum positive pressure provided is 14 mm. of mercury (19 cm. of water); the maximum negative pressure is 9 mm. of mercury (12 cm. of water). These pressures, of course, obtained in all of the twenty-five experiments. The apparatus was set to cycle fourteen or fifteen times per minute. The volume of gas flow per minute, as measured by a Precision flow meter introduced in the circuit in dogs of various weights, varied from 300 to 500 cc. per minute. In a dog weighing 9 Kg., for example, the minute volume of ventilation, using 100 per cent oxygen, was 400 cc. In the first 10 dogs 100 per cent oxygen was used and in the last 10 dogs 3 per cent carbogen (3 per cent carbon dioxide and 97 per cent oxygen), and in 5 both 100 per cent oxygen and 7 per cent carbogen.

The E and J Resuscitator was chosen because it has both positive and negative pressure. It was assumed that if the apparatus caused no lung damage or deleterious circulatory effects the results would apply not only to other "suck and blow" devices with the same maximum pressures but also to intermittent positive pressure devices having the same maximum positive pressure.

After making control observations for fifteen or twenty minutes, curare was injected to paralyze the muscles of respiration. A dose of 0.5 cc. per kilogram of body weight of Merck's curare solution number 569 was adequate usually to paralyze completely or almost completely the diaphragm and intercostal muscles. Occasionally additional amounts were required. In an occasional dog in which very feeble movements persisted, doses of 2 cc. per kilogram of body weight were

29. Maloney, A. H.: *Anesth. & Analg.* 23: 39, 1944.

30. Volpitto, P. P.; Woodbury, R. A., and Abreu, B. E.: *Influence of Different Forms of Mechanical Artificial Respiration*, J. A. M. A. 126: 1066 (Dec. 23) 1944.

ineffective. Larger doses were not given because we did not consider complete paralysis necessary for our purpose. The resuscitator was started after the curare was injected and at the point of almost complete paralysis of the muscles of respiration. At fifteen minute intervals the resuscitator was turned off and the inhalator on for one or two minutes to ascertain the state of activity of the respiratory muscles. This was done because Stewart³¹ has observed that at times during resuscitation of the respiratory center from anemic anoxia with the vagi intact the rhythm of the artificial respiration is impressed on the respiratory center.

Appreciable endogenous respiratory movements occurred after from thirty to ninety minutes. In half of the dogs it occurred between thirty and sixty minutes and in the remainder after sixty minutes (table 2). When endogenous movements returned, the artificial respiration was continued except for brief periods until the animal could maintain the oxygenation of the blood sufficiently to allow recovery. This means that all the dogs received artificial respiration for from one up to three hours. We did not maintain the animals longer because we believed that "suck and blow" devices will be ordinarily used for resuscitation for a period of less than an hour.

When the animal's natural breathing was adequate, the wounds were aseptically closed, 10 mg. of ephedrine was injected subcutaneously and the animal was kept warm until it recovered from the anesthesia. (The animal was also kept warm during the experiment.) The animals were killed three days later by the following procedure: The animal was anesthetized with pentobarbital. The trachea and carotid artery were exposed. The animal was then bled and the trachea clamped at the end of inspiration. The chest was then carefully opened to ascertain whether pneumothorax or collapse of a lung was present. The lung was then examined, including a search for evidence of interstitial and mediastinal emphysema; sections were taken for microscopic examination in a few instances.

Only 1 dog was killed immediately after the period of the artificial respiration; he had been under the artificial respiration for over two hours. There was no evidence of interstitial or mediastinal emphysema. Other animals in this group were not studied because we were interested only in whether damage of a significant degree would occur, because it did not occur in the experiments of Marcotte and his colleagues,¹⁸ who used 18 mm. of mercury of continuous intrabronchial pressure for eighteen to seventy-five minutes in the dog, and because we desired to look for emphysema under a somewhat more rigorous condition.

C. In order to ascertain whether interstitial or mediastinal emphysema might occur under the pressure conditions imposed by the E and J Resuscitator in the presence of natural breathing, the following method was used:

The dogs were anesthetized with pentobarbital and fitted with a pneumograph. The mask was fitted and a control record of respiration was made. Then the E and J Resuscitator was started with 100 per cent oxygen and kept operating for one hour; after that, 7 per cent carbogen was administered for ten minutes. The dog was then killed by bleeding and the trachea clamped at the end of an inspiration. The chest was carefully opened, as stated before; the lungs and mediastinum were inspected with a 16 diameter magnifying

lens, and sections were taken immediately for microscopic study.

D. Experiments were also performed in which the return of blood pressure to normal after the injection of curare was studied in relation to the type of resuscitator used. We used (a) the E and J Resuscitator, (b) an intermittent positive pressure resuscitator with some continuous insufflation at 10 mm. of mercury pressure, (c) the G. E. Pneumolator, which is a positive pressure (14 mm. of mercury) resuscitator, and (d) the Drinker respirator for infants.

RESULTS

The pathologic findings are summarized in table 1.

A. *Control Series.*—Of the 102 dogs in the control series 15, or 15 per cent, had a patch or patches of consolidation varying from 1 cm. in diameter up to as many patches as would yield an estimated total of 33 per cent consolidation. The consolidation ranged from 10 per cent to 30 per cent in 7 of the 15 dogs, or 7 per cent of the 102 dogs. Sixteen, or 15 per cent, of the remaining had minor pathologic changes consisting of petechial or small ecchymotic hemorrhages, scars or marginal emphysematous blebs. Seventy-one had perfectly normal lungs.

This shows that in the absence of a careful physical examination of the chest, or a roentgenogram, during the winter months 7 per cent of dogs can have an appreciable bronchopneumonia and appear "clinically normal."

B. *Treated for Recovery Series.*—Two dogs died, 1 at forty-eight and the other at seventy-eight hours after recovery from the experiment; both had bronchopneumonia. The one that died at forty-eight hours had an area of consolidation measuring 12 by 8 by 4 cm. The central portion of the area manifested gray hepatization. The lobe had other small patches of bronchopneumonia. The one that died at seventy-two hours had an area of consolidation of 6 by 4 by 4 cm. and other small patches of bronchopneumonia. This dog had some empyema and pneumothorax, which was due to the rupture of three marginal emphysematous blebs at the margin of the consolidated area described. There were areas of gray hepatization in the consolidated area. The presence of gray hepatization strongly indicates that pneumonia had been present for five days or was present at the time of the experiment. This interpretation is sustained by the findings on the control series. Minor changes were found in 4 (16 per cent) of the dogs.

Considering the control series, pathologic findings in this group cannot be attributed to the treatment. The study of the sections simply confirmed the gross diagnosis. The treatment may have aggravated the existing pneumonia, but this is not proved, and a very large series would be required to prove it. Joannides³² reports that pneumonic, consolidated, dark colored lungs when subjected to increased intrapulmonic air pressure (25 to 35 mm. of mercury in the dog) either inside or outside of the body became crepitating and pinkish red again. He does not recommend that positive pressure be used in pneumonia, however.

C. *Treated During Natural Breathing.*—Interstitial or mediastinal emphysema was not found by microscopic examination or by examination under a magnifying lens in the dogs given artificial respiration during natural breathing.

32. Joannides, Minas: Insufflation of Compressed Air in the Treatment of Pneumonia, *Arch. Int. Med.* 47: 196 (Feb.) 1931.

In this group of experiments it was found, as in the foregoing experiments, that some dogs during natural breathing followed the artificial respiration and some did not. At times the same dog would follow the rhythm of the machine and then again would not, as shown in the tracing. In no instance was the lack of synchronization between natural breathing and the machine serious.

TABLE 1.—Incidence of Lung Abnormalities in Resuscitated Dogs Compared with Dogs Which Received No Resuscitation Treatment

Lung Condition	Resuscitated Dogs		Control Dogs	
	Number	%	Number	%
Bronchopneumonia.....	2	8	15	15
Minor pathologic changes.....	4	16	16	15
Normal.....	19	76	71	70
Total.....	25	100	102	100

The only evidence of interference was a notch in the normal respiratory curve. The minute volume of ventilation remained the same except when the natural respiratory excursion was small; then the minute volume was greater with the machine.

D. Observations on the Circulation with Three Resuscitators and One Respirator.—The curare was injected rather rapidly with the idea of obtaining a fall in blood pressure so that the effect of the various methods of artificial respiration on the return of blood pressure could be ascertained. After the injection of curare the blood pressure fell to a level which ranged from 30 to 60 mm. of mercury. It remained at this level for a variable period, usually four to ten minutes, and then slowly rose. As a general rule the blood pressure had returned approximately to the control level at the time spontaneous respiration returned. But, as stated before, the artificial respiration was continued until the spontaneous respiration was adequate to maintain the animal, since we desired to have the animal recover for postrecovery observation.

The averaged results on the return of blood pressure are shown in table 2. The results show that the time

TABLE 2.—A Comparison of the Rate of the Return of a Low Blood Pressure Due to Curare When Various Devices for Artificial Respiration Are Used

Type of Resuscitator Used	Number of Experiments	Blood Pressure		Return of Spontaneous Respiration Time, Min.	Pressure Re-spiratory Cycle	
		Before Curare, Mm. Hg	After Curare, Mm. Hg		Posi-tive, Mm. Hg	Nega-tive, Mm. Hg
E & J Resuscitator.....	20	126	100	42	14	8
G. E. Positive.....	7*	130	104	60	14	0
B. Positive.....	8	136	100	23	10	0
Drinker Respirator.....	7	128	108	41	8	0

* One dog was killed when, at about two hours, it appeared that the blood pressure would not return to the control level; that may have been due to an overdose of pentobarbital.

for the return of blood pressure to normal did not vary significantly when the E and J Resuscitator, the G. E. Pneumulator (intermittent positive pressure), the B. Resuscitator (intermittent positive pressure with some continuous insufflation) or the Drinker Respirator (infant type) was used. We interpret the results as showing that neither of the types of artificial respiration with the pressures employed interfered significantly with venous return. If a difference does exist, many animals would have to be used to prove it because of the variation which exists in different animals.

SUMMARY AND CONCLUSIONS

1. One hundred and two "clinically normal" dogs were studied for the incidence of pulmonary disease. The chest was not examined carefully for physical findings because this is difficult in the untrained animal. X-ray films of the chest were not made because of the scarcity of film. Fifteen per cent of the animals had bronchopneumonia, the areas of consolidation ranging from 10 to 30 per cent in 7 per cent of the dogs. Fifteen per cent of the animals had minor pathologic changes, such as petechial or small ecchymotic hemorrhages, scars or marginal emphysematous blebs. In the remainder (70 per cent) the lungs were normal.

2. Twenty "clinically normal" dogs were anesthetized, given curare and artificial respiration with the E and J Resuscitator, a suck (—9 mm. of mercury) and blow (+14 mm. of mercury) type, for one to three hours. The animals were then permitted to recover and were killed three days later and the lungs examined by a method permitting the discovery of pneumothorax and interstitial or mediastinal emphysema. Two dogs (8 per cent) died of bronchopneumonia within seventy-eight hours; since gray hepatization was present, the bronchopneumonia must have been present at the time

Illustrating that an animal in coma (anesthetized) but breathing naturally may or may not follow the rhythm of a mechanical resuscitator of the "suck and blow" type. In the first section of the tracing the animal was breathing naturally. In the second section the E and J Resuscitator was ventilating the animal (note that the animal is "following" the resuscitator). In the third section the animal is apparently not "following" the resuscitator, but when the resuscitator is turned off and the animal allowed to inhale 100 per cent oxygen without pressure naturally the natural respiration is irregular, a condition which continues after the resuscitator is turned on again. An irregularity of the respiratory excursion may occur during natural breathing in anesthetized or comatose animals.

of the experiment. Four (16 per cent) of the dogs had minor pathologic changes in their lungs. In the remainder (76 per cent) the lungs were normal.

3. There is no evidence in this study that artificial respiration of the suck and blow type (+14 mm. of mercury and —9 mm. of mercury) caused lung damage.

4. In 5 anesthetized dogs given artificial respiration with the E and J Resuscitator for one hour in the presence of natural breathing no evidence of emphysema was found.

5. The rate of return of blood pressure to the control level after the administration of curare was studied when dogs were given artificial respiration by various mechanical methods for one to three hours. The E and J Resuscitator was used on 20 dogs, the General Electric intermittent positive pressure Pneumulator on 7, the B intermittent positive pressure device on 8 and the Drinker Respirator on 7. No difference was found.

SATURDAY, DECEMBER 29, 1945

INFECTION AND REINFECTION IN TUBERCULOSIS

Since the work of Parrot, Küss, Ghon, Ranke and many others there has remained little doubt that the origin of tuberculous disease in infants and young children is almost exclusively the first contact with tubercle bacilli. Furthermore, Koch, Romer, Krause and many others found that it was difficult to superinfect an active infection in experimental animals. By analogy an exogenous reinfection in children before 3 years of age probably does not occur often if at all, because the lesions do not have time to heal within that time.

At one time most adult tuberculosis was thought to arise from these early infections. Late in the last century Behring made the often quoted statement that fatal tuberculosis was the "last verse of the song begun in the cradle." Not all were in agreement with Behring's hypothesis, however, because Nägeli, Orth and others had been reporting the presence of healed calcified tuberculous lesions on necropsy in practically every adult. As late as 1926 Schürmann¹ found that almost all adults possessed some tuberculous lesions—mostly healed and calcified. The tuberculin reaction supported the finding of a nearly universal infection in the large centers of population. The use of tuberculin by Hamburger and Monti,² Armstrong,³ Veeder and Johnston⁴ and others indicated that most of the people in the large centers of population were infected by the time they reached adult life. With apparently so many lesions existing in the world, it seemed probable that healing must take place or every one would be ill or have latent disease. Although many early experiments reported a high percentage of tubercle bacilli in calcified

tuberculous lesions, Rabinowitch⁵ and Aronson and Opie⁶ found a much lower percentage of positive lesions. More recent studies⁷ have demonstrated that only a small percentage of the lesions contain living tubercle bacilli. Practically none of the "petrified" or "ossified" lesions contain living bacilli. The conclusion was correct that most calcified lesions were probably healed.

The next logical question was whether these healed infections protect against subsequent reinfections, as animal experiments seemed to indicate. Many felt that there was real immunity conferred by a healed infection. Even if all the lesions were healed and afforded complete protection (as they surely do not) not all persons were infected in early life. Bushnell,⁸ Borrel⁹ and others showed that aboriginal people presented less evidence of infection as they were remote from civilization. A similar variation also existed in certain civilized communities. In rural Minnesota as early as 1924 Slater¹⁰ found that only 10 per cent of high school children had positive tuberculin (Pirquet) reactions by the time of graduation. Schœl¹¹ in Norway, Myers¹² in Minneapolis and Taylor¹³ in Iowa supported Slater's observations.

Not only did tuberculosis vary from place to place, but there was increasing evidence that the incidence of the disease was rapidly decreasing. The best confirmation of this statement, besides the decrease in mortality, was the work of Chadwick and Zacks¹⁴ in Massachusetts, who found the incidence of the disease in 1930 to be about half that found by Armstrong in 1917. Furthermore, Chadwick and Pope¹⁵ found 28 per cent positive tuberculin reactions in grade school children in 1924 and only 14 per cent positive in 1939. It is evident that there is a vast difference in the tuberculosis infection rate, total infection, morbidity and mortality in different parts of the world, even in different parts of every country, and the incidence is changing all the time. Except in war and famine, at least in the more civilized countries, the rate is decreasing.

Observations reported on special groups of patients should not be deceptive. For example, the fact that

practically all infants and young children who die of tuberculosis do so as a result of the primary infection does not indicate that a larger number of childhood infections survive, as shown by Bernard¹⁶ and by Kjer-Petersen and Ostenfeld.¹⁷ The majority of these survivors live to become reinfected later. The same may be said regarding the question of endogenous reinfection, as reported by Sweany,¹⁸ Page¹⁹ and others. Although young adults in particular show a preponderance of endogenous reinfections, it must be remembered that many more infections heal than result in death and in healing become subject to later reinfections.

The percentage of persons who heal compared to those who die is not known, largely because there are so many variable factors, but there is little doubt that for every person dying of tuberculosis many more survive, and the proportion of survivors to those infected increases in the older age groups. Exogenous reinfection, therefore, increases in importance with age. As the percentage of uninfected persons increases, that is, as adult life and old age are attained without a first infection, reinfections become less and less significant. The time has by no means come, however, to disregard reinfection on that account.

Theoretically, then, infection and reinfection can occur at any time if the dosage and virulence of the bacilli are high enough and if the host has a low resistance as the result of a susceptible age, sex or race or if there has been a loss of resistance, as in old age. This holds true also in any case in which the first infection was slight and a long interval of time elapsed between the first infection and the reinfection. A patient with active tuberculosis expels millions of bacilli daily, may infect any one, and therefore is a menace not only to the uninfected but also to those in the older age group who have healed infections.

Old age tuberculosis has no doubt been largely overlooked in the past except at necropsy. Recently there have been a number of reports on tuberculosis in persons in the older age groups—probably not because the disease is more prevalent but because better diagnoses are being made.

Probably well over half of the fatal cases of tuberculosis still arise endogenously from the first infection, and as the infection rate decreases the importance of reinfection decreases. There is, however, a large percentage of clinically significant and even fatal disease in which the infections are due to exogenous reinfections, which may be few in the young, many in early middle life and quite prevalent in the old.

ANTITOXIC ACTION OF PENICILLIN

Boor and Miller¹ of the Kuppenheimer Foundation, University of Chicago, have recently demonstrated that penicillin has a synergic neutralizing action on certain endotoxins. Endotoxins were prepared from six strains of type I and one strain of type II meningococcus. The concentration of each preparation was so adjusted that 0.3 to 0.5 cc. injected intraperitoneally killed at least 4 of 5 mice within thirty hours. Among 179 untreated control mice thus injected 159 died within thirty hours, a mortality of 89 per cent. In comparison 74 mice were injected intraperitoneally with the same doses mixed with 1,000 or more units of penicillin. Of these 59 died within the prescribed time limit, a mortality of 80 per cent. Boor concluded from these percentages that penicillin acting in vitro on meningococcus endotoxin does not reduce its toxicity to any significant degree. This conclusion accords with that previously reported by Neter and Will,² who found that tetanus toxin mixed with sodium penicillin was as toxic as tetanus toxin alone.

In a second series of experiments Boor injected the same amounts of endotoxin intraperitoneally into mice which were treated by a series of subcutaneous injections with penicillin. Of 373 mice thus treated 122 died, a mortality of but 33 per cent.

The antitoxic effect was even more apparent in several groups of mice injected with smaller doses of endotoxin. One group of 24 mice was injected with but 0.25 cc. of standard endotoxin. The control mortality was 100 per cent, contrasted with but 20 per cent mortality among those given subcutaneous penicillin therapy. Experiments were also done on rabbits. In rabbits the endotoxin was injected intravenously and penicillin given subcutaneously in doses of about 10,000 units every few hours. All untreated control rabbits died within twenty-four hours (mortality 100 per cent). Among 16 treated rabbits 14 survived and 2 died at thirty-six and forty-five hours respectively, a mortality of but 12.5 per cent.

These experiments confirmed the previous conclusion that penicillin repeatedly administered subcutaneously is able to exert a considerable degree of protection against the lethal effects of meningococcus endotoxin. This protective action is almost completely destroyed when penicillin is inactivated with penicillinase.

The Chicago investigators have not yet proposed a theory to account for this presumptive synergistic antitoxic effect of penicillin, a new phenomenon of clinical promise.

Current Comment

FIBROSITIS OF THE BACK

Copeman and Ackerman¹ reported in 1944 a clinical study of "fibrositis" of the back in which the pain was studied clinically and the occurrence of trigger points confirmed. The exact situation in which these occurred in a large number of patients was charted and the pain pattern of definite shape obtained. The dissection of 14 bodies of persons dying from various causes, excluding those of fibrositis, established the existence of a basic fat pattern. This fat pattern was observed to correspond exactly in shape and situation with the pain pattern already charted. Lesions suggestive of inflammatory reaction were not found in any deep fibrous tissue, but certain abnormalities affecting the lobules of the fat pattern were found in several instances. The abnormality which seemed most likely to have clinical significance was the herniation of certain fat lobules through weaknesses or actual deficiencies in the walls of their investing fibrous tissue. A series of 10 biopsies of selected patients suffering from fibrositis were reported in full. Although the authors think that the microscopic lesions described in the removed fat may be causative of the pain, they believe that its basic origin lies in an increase of tension in the fat lobules affected where they are invested by a nondistensible fibrous membrane. The anatomic lesions found were probably a later result of this condition where it persists. Further clinical support to the concept of herniation of fascial fat as a cause of back pain is offered by Herz,² who reports a striking relief of pain in 6 patients suffering from excruciating pain in the back. In all of his cases there was a history of trauma due to strain, which had initiated the pain. Pain in the back was extremely severe in all and in some instances was referred down one leg. In all cases a definite mass was palpable which was extremely tender, and pressure on it intensified the pain. Injection of these masses with procaine solution provided temporary relief in all instances. In these 6 cases, fairly wide dissection of fat in the painful area has relieved the pain whether or not the herniation could be clearly delineated. Mylechreest,³ who dissected 12 backs of bodies post mortem, furnishes additional information. In several of the bodies a herniation of fat from one layer of fascia to another was found. In 12 biopsies on selected patients suffering from fibrositis of the back, fatty lobules under tension or fatty hernias were discovered. Their removal resulted in cure in most cases or striking relief in those not completely cured. The fat hernia, according to Mylechreest, may be congenital in origin, where a mass of fat passes through one or more layers of fascia through well defined gaps, or acquired, the result of a mechanical or postural factor. The pain of "fibrositis" may be due to pathologic changes found in these areas, namely edema of the fatty tissue, hemorrhage, congestion or

torsion of the pedicle of the prolapsed lobule. Herz suggests that the operation for the release or removal of prolapsed herniation of fascial fat is not a panacea for all types of low back pain. However, if the possibility of such a lesion is recognized and a careful examination is made for palpable masses which may prove to be trigger points of pain, numerous patients may by this procedure be relieved of a condition that has been incapacitating, sometimes for many years.

CONFERENCE ON BARBITURATES

The Committee on Legislation of the American Pharmaceutical Association recently called a conference to study the promiscuous distribution of the barbituric acid compounds. The meeting was attended by representatives from the American Pharmaceutical Association, American Medical Association, Food and Drug Administration, U. S. Public Health Service, U. S. Bureau of Narcotics, American Dental Association and other groups and agencies. Discussion was held on barbiturate regulation, barbiturate habituation and tolerance and the medical, pharmaceutical and legal aspects of the problem. At this time fourteen states and the District of Columbia have no law regulating the sale and distribution of barbiturates. The laws in the other states are not uniform and have been subjected to much abuse. Today many people are aware of the action of this group of drugs; accidental deaths, suicides and ill health directly attributable to the effect of the drugs are on the increase. Careless prescribing, direct sales to the consumer and "bootleg" distribution have aided those who are determined to get the drug. Some have proposed the adoption of a federal law which would regulate the distribution of barbiturates much as opium derivatives are now controlled. More are in favor of control on the state level, particularly if a uniform state act can be formulated and adopted. The problem needs much study. Further study should develop a satisfactory solution.

PROMIN IN LEPROSY

Faget and Pogge¹ at the National Leprosarium in Carville, La., report clinical improvement in 137 patients with lepromatous and mixed types of leprosy treated with promin. The drug acts slowly, and improvement usually becomes manifest only after six or more months of treatment. The longer the duration of promin therapy and the larger doses of the drug tolerated, the greater is the degree of improvement. Since *Mycobacterium leprae* cannot be cultivated on artificial mediums nor the human disease reproduced in laboratory animals, bacteriostatic or bactericidal action of promin is difficult to prove. However, 62 patients were treated with promin for more than one year, with diminution in the number of *M. leprae* organisms in the lesions in at least 40 per cent. Research may produce a faster acting, more specific, drug for the mycobacterial diseases, but promin is considered the best experimental treatment thus far tested at the National Leprosarium.

MEDICINE AND THE WAR

ARMY

DISTINGUISHED SERVICE MEDAL

Major General George F. Lull

Major Gen. George F. Lull, Deputy Surgeon General of the Army, was recently awarded the Distinguished Service Medal for "exceptionally meritorious conduct in the performance of outstanding services in the Office of the Surgeon General from June 1940 to August 1945." The citation accompanying the award stated that "in his capacity as chief of personnel service he was responsible for developing plans to augment the various officers' corps and the enlisted and civilian personnel of the Medical Department during the nation's first total mobilization of medical manpower. As Deputy Surgeon General he was largely responsible for establishing policies and directing studies which resulted in many outstanding medical achievements such as the advancement in preventive health measures, the remarkably low incidence of disease and the low mortality from both disease and battle wounds. General Lull's skilful discharge of difficult duties and his devotion to the mission of the medical department contributed in important degree to the success of the Army's unprecedented medical program." General Lull graduated from Jefferson Medical College of Philadelphia in 1909 and was commissioned in the Army Medical Reserve in 1912.

Major General Shelley U. Marietta

Major Gen. Shelley U. Marietta, commanding general of Walter Reed General Hospital, Washington, D. C., was also the recipient of the Distinguished Service Medal. The citation accompanying the award stated that as commanding general of Walter Reed General Hospital as well as of the Army Medical Center and a commandant of the Medical Department Professional Service Schools from December 1939 to August 1945 he "displayed outstanding leadership and administrative and professional ability of a high order in discharging his highly responsible duties. He organized and trained medical department units and personnel in medicomilitary activities while at the same time carrying out his responsibilities for the proper performance of the many-times expanded missions of the Army Medical School, the Enlisted Technicians School, the Army Dental School, the Army Veterinary School and the Walter Reed General Hospital. Under his guidance the armywide needs for blood plasma and both the Army and Navy needs for immunizing biologicals were always fulfilled. He helped pioneer numerous innovations for the care and treatment of the sick. General Marietta's contribution to the war effort, made possible by the diligent application of his exceptional talents, was an important one and reflects highest credit on himself and the military service." General Marietta graduated from the University of Illinois College of Medicine, Chicago, in 1909 and entered the service May 1, 1912.

Brigadier General James S. Simmons

Brig. Gen. James S. Simmons, Washington, D. C., was recently the recipient of the Distinguished Service Medal. The citation stated that "the service he organized and developed carried out a worldwide program of military and civil public health which secured both immediate and enduring benefits by reducing hazards to the health of the troops, civilians engaged in essential war work, and refugees and displaced persons. By applying the best available knowledge and fostering research, he developed and extended new information on the causes and prevention of communicable diseases, on the improvement of nutrition for soldiers and on the reduction or elimination of the health hazards of mechanized warfare and industrial occupations. His teachings, influence of personality and adherence to ideals inspired and established a positive concept of health for troops and civilians. With

extraordinary foresight he was in advance of events, devising measures for health protection before critical needs arose, and with dynamic energy he overcame severe difficulties. By protecting the health of the Army and conserving the health of the nation, General Simmons contributed to winning the war." General Simmons graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1915 and entered the service Feb. 10, 1917.

Brigadier General Raymond W. Bliss

Brig. Gen. Raymond W. Bliss, assistant Surgeon General of the Army, received the Distinguished Service Medal for "exceptionally meritorious conduct in the performance of outstanding service from June 29, 1943 to Aug. 31, 1945." The citation further stated that "General Bliss was responsible for the development and supervision of the medical plan in overseas theaters and in the zone of interior, which through its excellence provided the finest medical service in the history of the Army and resulted in the lowest morbidity and mortality experience. Through personnel planning and control, through specialization of facilities, through the furtherance of such new developments as air evacuation and convalescent hospitals, General Bliss contributed uniquely to the treatment and welfare of the sick and wounded and the accomplishment of the medical mission." General Bliss graduated from Harvard Medical School, Boston, in 1910 and was commissioned in the Army Medical Reserve Corps in 1911.

ARMY MEDICAL LIBRARY HONORARY CONSULTANTS MEET

The second annual meeting of Honorary Consultants to the Army Medical Library was held recently in Cleveland for the purpose of electing officers to the association. The following officers were elected: Dr. John F. Fulton, president; Dr. Chauncey D. Leake, vice president; Col. Harold W. Jones, secretary-treasurer. Major Gen. George F. Lull was elected on the executive committee.

ARMY AWARDS AND COMMENDATIONS

Colonel William S. Middleton

The Legion of Merit was recently awarded to Col. William S. Middleton, formerly of Madison, Wis., for "outstanding services as chief consultant in medicine, Professional Services Division, Office of the Chief Surgeon, in which capacity he established and directed the consultative services in medicine in the European theater." Dr. Middleton graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1911 and entered the service April 27, 1942.

Colonel Paul G. Hansen

Col. Paul G. Hansen, formerly of North Olmsted, Ohio, and now attached to a medical detachment in China, was recently awarded the People's Hero Medal by the Chinese government. For the last two years he has been in charge of hospitals in central and western China. Some time ago he was awarded the Bronze Star. Dr. Hansen graduated from St. Louis University School of Medicine in 1933 and entered the service April 22, 1940.

Captain Herman Beigelman

Capt. Herman Beigelman, formerly of Boston, was recently awarded the Bronze Star for meritorious achievement in connection with military operations in Italy. Dr. Beigelman graduated from Tufts College Medical School, Boston, in 1937 and entered the service Nov. 20, 1942.

MISCELLANEOUS

AWARD OF UNITED STATES OF AMERICA
TYPHUS COMMISSION MEDAL

Col. Richard T. Arnest, formerly of Fort Benning, Georgia, was recently awarded the United States of America Typhus Commission Medal. Accompanying the award was a citation "for meritorious service in connection with the work of the United States of America Typhus Commission during the outbreak of epidemic typhus fever in southern Italy, particularly during the period from Dec. 20, 1943 to Feb. 20, 1944. Colonel Arnest from his position as surgeon, Peninsular Base Command, made available to the commission personnel and facilities. In addition he carried out all responsibility for applying measures necessary to the prevention of the occurrence of typhus fever in United States Army forces in the Naples area. His contribution not only assisted typhus control among civilians but also safeguarded the health of troops." Dr. Arnest graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1916 and entered the service July 1, 1920.

Lieut. Col. Wilson C. Williams, formerly of Nashville, Tenn., was recently presented the United States of America Typhus Commission Medal. According to the citation accompanying the award, "as deputy director of public health subsection, Allied Control Commission, and director of the typhus control branch of that subsection, he rendered extremely valuable services in planning for antityphus supplies, in training personnel and in assisting in the coordination of activities for the control of typhus during the outbreak of this disease in Naples and southern Italy during the period from December 1943 to February 1944. After the withdrawal of the United States of America Typhus Commission from control work at Naples, Colonel Williams continued an effective campaign against typhus in southern Italy." Dr. Williams graduated from Vanderbilt University School of Medicine in 1925 and entered the service Aug. 18, 1943.

A BRITISH TRIBUTE TO THE
AMERICAN PHYSICIAN

In the London *Lancet* for October 20, page 507, an anonymous writer ventures a few reminiscent thoughts relative to the association of the British physicians with their American colleagues during the period of the war. It is a charming statement in which every medical reader should take pleasure. The statement follows:

They came, at first a few and then a drove, the Æsculapiads of the New World to succour wartorn Europe. Khaki-clad and with British names and customs they shared our clubs, our meetings, and our firesides. Up sprang their hospitals almost overnight: clean wards and messrooms, well-ordered stores, theatres, and pharmacies. In their laboratories were shiny benches, virgin glassware, and crystal-clear solutions. Smart white-gaitered sentries "checked in" from their white-painted control offices. In the motor pool stood strange high monsters of the road, regimented for war and errands of mercy. There were libraries, cinemas, and baseball grounds, as well as cosy bars with lantern lights, iced fruit cocktails, and exotic wall-paintings. They shared out parcels from home in their warm Nissen huts and put up on the stark concave walls photographs of their far-away families. Off plain deal tables they ate pre-fabricated steaks and Maryland chickens with apricot jam. They poured out sweetcorn from cans and treated us to large fruity ices and hot chocolate sauce. There was pride in their handicraft, as their chapels showed, for only their best would do. Everywhere efficiency and quality, with sufficient of everything for the job in hand. Then came the convoys and their jobs began. The sterilisers steamed, the X-ray plants hummed, and the centrifuges roared. The purple dressing-gowns of the convalescents made their welcome appearance as blood, penicillin, and faith in the future speeded them back to their units.

The months passed and we got to know them—colonels, doctors, nurses, and enlisted men. Many were the meetings and the consultations. They treated our men and we treated theirs. They came to learn, youths of a young nation, but they taught us much. They transformed our sleepy towns into energetic schools of medicine. In leisure hours they swarmed our country lanes on bicycles and in rare bouts of sunshine played with our children on the greens, giving them candies and peanuts. Some

married our daughters and our sons. They loved our ancient churches and studied the flowers in our meadows. They had aunts to visit, ancestral homes to photograph, and souvenirs to seek. The aroma of strange tobacco pervaded our streets. Hospitable and witty, they were the possessors of good manners and good teeth. They tolerated good-humouredly our lack of central heating and culinary understanding, and enjoyed above all the humble cup of tea in the family circle. They told us of their homes and we wrote to their families. Strange world that they who speak our language, share our jokes and ancestry, and fight the same battle against disease should be reckoned foreigners to us and we foreigners to them. Citizens of the same world, we must needs be in separate sovereign States and perhaps willy nilly be required to serve separate interests.

They went as quickly as they came, for the lightning has severed the chains of bondage. The hospital trains have ceased to run. The wounded are healed and have left for home. The hospital cities are dismantled and the men in the Nissen huts have packed their books, souvenirs, and photos and filed off to the ports in their fantastic trucks. The bulldozers have levelled the last dump of empty cans and all is still. There is dust on the empty shelves of the pharmacy, the little trim gardens are overgrown, and the white sentry-box is empty. Now, only the miniature house is inhabited which the mess sergeants built for the tomtits. The abandoned huts sadden our eyes as we recall friendships fashioned in the hinterland of war. The stimulus of their presence is now a memory, for three thousand miles, and a disordered world economy, separates us from them, truly our cousins. And our lazy old town has lapsed into dreams again.

But they will write and remember us. And we shall not forget them.

PS.—I wish we had a cosy bar in our hospital.

UNRRA NEWS

Successful Experiment by Sweden

Dr. R. L. Coigny, UNRRA's medical chief for displaced persons in Europe, recently reported the success of an experiment by Sweden in cooperation with UNRRA in building up children starved by the Nazis. Though not a member of the United Nations, Sweden has accepted through UNRRA a total of 31,000 slave laborers and war victims who were in especially bad health when liberated from Nazi prison camps last spring. The Swedes provided the refugees with a diet of 4,800 calories daily, although the normal ration for Swedish citizens is only 3,800. The enjoyment of plenty following the privation and suffering experienced by these people under the Nazis has not only rehabilitated them physically at an unusual rate but has also helped to restore their mental health with remarkable rapidity. The displaced persons are housed in 150 centers of different types, some being large converted country houses, others gaily painted bungalows, all located in beautiful surroundings.

Although Sweden has borne the entire cost of their care, UNRRA is cooperating on plans for their repatriation. Originally turned over to UNRRA in Germany by the military forces after their liberation, the displaced persons were registered by UNRRA workers at Lubeck and transported across the Baltic aboard Swedish ships. The transfer took place between June 25 and July 27. Sweden has placed no specific limit on the time they may remain in hospitals or convalescent centers.

Medical Supplies to Italy

The United Nations Relief and Rehabilitation Administration, Washington, D. C., recently made a shipment of 900 tons of medical supplies for distribution through Italian government authorities, and more are on the way. Mr. Rickard K. Myers, assistant chief of UNRRA's Medical and Sanitation Supplies Division, is in Rome to aid in supervising the distribution. The shipment was made up of 23,000 separate cases of the vital medicines and equipment. Already 2,800 cases have been shipped to provinces most in need of them, including Sicily, Lucania, Campania, Abruzzi and Lazio, and they are being distributed to hospitals and health centers for immediate use. UNRRA already has provided 100 ambulances in Italy, which it obtained from military surpluses in Europe.

Wyoming

Giovale, Silvio J., Major, Rock Spring.

Hawaii

Chang, Hon C., Capt., Lihue, Kauai.
Chumming, Archie, Major, 164 S. Vineyard St., Honolulu.
Depp, Donald S., Capt., Waipahu Hosp., Waipahu, Oahu.
Kainuma, Richard T., Capt., Waialua, Oahu.
Kawasaki, Isaac A., Major, 307 N. Kukui St., Honolulu.
Luke, Leslie N., Y., Capt., 1189 Bethel St., Honolulu.
Stilson, Homer O., Major, Waianae.
Stitt, Albert, Capt.
Tong, Pook H., Major, 1927 Coyne Ave., Honolulu.

Puerto Rico

Juenez, Roberto J., Major, 97 Ponce de Leon Ave., Santurce.
Matta, Enrique L., J., Capt., Pajardo.
Nieves-Colon Juan de la Cruz, Capt., 33 General Contreras St., Cayey.
Oms, Luis R., Major, Municipal Hosp., Humacao.

CHANGES

Cable, Wilbur G., Capt., Benedict.
Grod, Charles I., 1st Lt., Cambridge.
Rosenthal, Arthur D., Capt., Vt. Adm. Facility, Lyons.

Foregoing officers have not been relieved from active duty.

MEDICAL OFFICERS RELEASED BY THE NAVY

The figures in the Personnel Division of the Bureau of Medicine and Surgery indicate that 1,259 medical officers have been released and their records closed in this bureau, and information from the Bureau of Naval Personnel indicates that 1,635 medical officers are under orders for release from active duty, making a total of 2,894 separated or under orders for separation as of Dec. 1, 1945. The critical score effective Jan. 1, 1946 makes 5,583 medical officers eligible for separation. This number does not include medical officers released by reason of hardship, limited shore duty or affiliation with teaching institutions and hospitals.

ORGANIZATION SECTION

Official Notes

CONFERENCE OF STATE SECRETARIES AND EDITORS

The Conference of State Secretaries and Editors, which was originally scheduled to be held in November 1945, will be held at the offices of the American Medical Association in Chicago on Friday and Saturday, Feb. 8 and 9, 1946. Two sessions of the conference will be held on Friday, February 8, one session at 10 a. m. and the other on the afternoon of that day. On the evening of February 8 a program intended to be of particular interest to the editors of state medical journals will be presented. The concluding session of the conference will be held at the offices of the American Medical Association on the morning of Saturday, February 9.

Officers of constituent state medical associations and of component or district medical societies will be heartily welcome to attend the conference. All who expect to attend are urged to make necessary arrangements for transportation and for hotel accommodations at the earliest possible time.

NEW APPOINTMENT

Dr. A. Ray Dawson, who was recently relieved from service with the rank of lieutenant colonel, has been appointed assistant to the Secretary of the Council on Industrial Health of the American Medical Association, effective November 15. Dr. Dawson will be in charge of workmen's compensation and rehabilitation. Prior to his association with the reconditioning and rehabilitation program of the Army Air Forces, Dr. Dawson was affiliated with the Jefferson Standard Life Insurance Company, Greensboro, N. C., and served as medical officer in the U. S. Civil Service Commission, Washington, D. C. He graduated at the Medical College of Virginia, Richmond, in 1929.

Washington Letter

(From a Special Correspondent)

Dec. 17, 1945.

Committee Named to Coordinate Government Medical Services

President Truman has named Dr. Harold W. Dodds, president of Princeton University, head of a committee to coordinate the government medical services and to find ways of increasing medical facilities of the Veterans Administration. Also Major Gen. Paul R. Hawley, acting Surgeon General of the Veterans Administration, has selected eleven doctors, headed by Brig. Gen. Elliott C. Cutler, to serve as chief consultants to the agency. The consultants will select leading doctors throughout the country to work with staff physicians on a part time basis. The move is planned to insure the highest medical standards for hospitalized veterans. General Cutler is Moseley professor of surgery at Harvard Medical School and is attached to the Peter Bent Brigham Hospital in Boston.

Medical Center Bill to Be Modified

House District Committee members have indicated informally that they will amend the District of Columbia hospital bill, passed by the Senate, so that the entire initial cost would be borne by the federal government. The Senate had asked that private hospitals affiliating with the center pay one third of the initial cost and repay the other two thirds over fifty years. Alternate drafts of the measure are being prepared, and Representative Dan McGehee, Democrat of Mississippi, committee chairman, hopes to get action on the bill soon. The proposed District medical center has been the subject of out-

spoken testimony. Senator Millard Tydings, Democrat of Maryland, has asked for consolidation of the Twelfth District private hospitals, calling them "antiquated, rat and roach ridden, uneconomical and dangerous fire traps." He estimated the cost of the proposal at approximately \$12,000,000. Major Gen. Philip B. Fleming, Federal Security Agency administrator, also asked for support of the measure, stating that the government might wholly finance an \$18,000,000 medical center on a 25 acre site to be selected. He said the center would include 1,500 beds, a nurses' home, a school and parking space for 500 cars. It would be supervised by a corporation formed by agreement between the government and private interests. General Fleming said that Washington now has a 1,700 bed hospital shortage.

Senate Approves Federal Hospital Aid Program

The Senate has voted its approval, and similar action is sought in the House, on the federal hospital aid program, which is expected to provide \$700 million in new construction during the next five years. The committee rejected a series of amendments offered by Senators Murray, Democrat of Montana, and Wagner, Democrat of New York, which they claimed would make the bill conform with President Truman's recent congressional message on a national health program. Senators Hill, Democrat of Alabama, and Taft, Republican of Ohio, worked together to defeat the Murray-Wagner proposals, which they said would remove proper state control of the program.

Influenza Vaccine Used by Army Is on Sale to Civilians

The vaccine used to vaccinate all army personnel this fall and winter against influenza types A and B is now on the market for civilian use. The vaccine is reported to be effective against the type B virus now causing outbreaks throughout the country. A check with producers reveals that Eli Lilly & Co., the Lederle Laboratories and the Pitman-Moore Company have the vaccine available now for civilian use. Pitman-Moore states that all its branches are being supplied. Parke Davis will have the vaccine available to civilians before January. The Squibb vaccine will be available for civilian use about February 15.

Bradley Won't End Segregation in Veterans' Hospitals

Demands of Negro leaders that segregation of white and Negro veterans in some Southern hospitals be ended has been refused by Veterans Administrator Omar N. Bradley. General Hawley, acting Surgeon General, advised General Bradley that the Veterans Administration could not be used as an agency for social change and must follow local customs. A delegation of twenty-five Negro organizations sought an interview with General Bradley to present their case. A survey recently conducted under General Bradley's orders shows that of the ninety-seven Veterans Administration hospitals seventeen do not accept Negroes except in emergency and that twenty-four have separate wards for Negroes. One hospital, at Tuskegee, Ala., accepts only Negroes. The remaining fifty-five make no distinction.

Warning by Vannevar Bush that Nation Faces Deficit of Scientific Capital

A short-sighted draft policy nearly wrecked the scientific side of the American war effort, states Dr. Vannevar Bush in his annual report as president of the Carnegie Institution of Washington. He said we are still drafting scientists and students of science, even though the war is over. The United States, he declared, drew so heavily on its "scientific capital" during the war that it now faces a "serious deficit" in young scientists. Many young scientists were taken out of laboratories during the war, and "we also sacrificed the future to immediate needs more than did any of our allies or, indeed, our enemies, by halting our processes of advanced education." He declared the nation must educate for scientific research all the brilliant young minds it can find in order to keep abreast of other countries.

AMERICAN RED CROSS DISTRIBUTION OF SURPLUS DRIED BLOOD PLASMA

NOTE.—This plan for the distribution and use of the surplus plasma has been presented to and concurred in by the Association of State and Territorial Health Officers, the American Medical Association and the American Hospital Association.

G. Foard McGinnes, M.D., National Medical Director.

During the war, large quantities of blood were given by the American people through the American Red Cross from which dried plasma was prepared for the armed forces. The supply of this material was predicated on the needs of the Army and the Navy for a long and costly war. Because of an earlier cessation of hostilities than was reasonably to be expected in both the European and the Pacific theaters, there is now in the hands of the Army and the Navy a quantity of dried plasma which is in excess of their needs during the anticipated useful life of the plasma, namely five years from the date of processing. According to army and navy estimates, the available surplus amounts to approximately one and a quarter million packages at the present time.

The transfer to the American Red Cross of dried plasma declared surplus by the Army and the Navy is provided for by Public Law 457 of the 78th Congress, approved Oct. 3, 1944. The pertinent portion of this law, section 11 (f), reads as follows:

"No surplus property which was processed, produced or donated by the American Red Cross for any government agency shall be disposed of except after notice to and consultation with the American Red Cross. All or any portion of such property may be donated to the American Red Cross, upon its request, solely for charitable purposes."

Under the foregoing provision of Congress, a formal request was made to the Army and the Navy that all surplus plasma be transferred to the American Red Cross. This action was taken on the ground that the American Red Cross has a responsibility to the American people to assure that plasma and other derivatives of the blood voluntarily contributed for the members of the armed forces be utilized to the best advantage and not wasted or offered for sale or barter. In making this request, it was proposed that any surplus should be returned to the American people, who had made these supplies of plasma possible, for use in veterans' hospitals and in civilian medical practice. This proposal was accepted by the Army and the Navy, and accordingly they will transfer to the American Red Cross all available surplus stores of plasma and other blood derivatives.

In developing a plan for the distribution of this material it was felt that the first consideration was that the needs of the Veterans Administration be met. We therefore discussed the matter with General Hawley and arranged to provide him with the amount of plasma which he has estimated will be required for use in Veterans Administration facilities during the next five years.

In planning for distribution and use in civilian medical practice there were three factors which we believed to be of particular importance: The distribution should be carried on in such a manner as, first, to assist in making possible an accurate determination of the needs for blood and blood derivatives in the various parts of the country; second, to strengthen and stimulate the development of already established state and local civilian blood and blood derivatives programs, and, third, to demonstrate the value of such programs and thus stimulate their establishment where they do not already exist.

The surplus dried plasma amounts to about one and a quarter million packages, which it is estimated will meet civilian needs for approximately two years. We are arranging for warehouse storage space in each of our five areas, the headquarters of which are located at New York City, Alexandria, Va., Atlanta, Ga., St. Louis and San Francisco. The available plasma will be apportioned to each of these areas on a population basis and supplied to state departments of health for distribution without charge to all physicians licensed to practice medicine and surgery, and to all acceptable hospitals for use in the treatment of any patient without charge for the product. This plan is similar to that which the state departments of health have been

following in distributing the surplus immune serum globulin made available by the American Red Cross for the prophylaxis and modification of measles.

The area medical directors of the American Red Cross will make arrangements with state departments of health for a satisfactory plan for the distribution of plasma within each state, in consultation with representatives of the state medical society and state hospital association. The American Red Cross will then make an initial shipment to the health department in an amount estimated to be a three months supply. This estimate will be based on the population of the state, weighted by the number of physicians and the number of general, pediatric and maternity hospital beds. Thus, every physician may, if he desires, carry plasma with him, and hospitals may be stocked with a reasonable supply for the treatment of their patients. Replacements of plasma may be obtained on request by physicians or hospitals from the state departments of health or through the local Red Cross chapter, if the department of health does not have a local distribution center. State departments of health in turn will obtain replacements of plasma up to a six months supply by requesting it from the area office of the American Red Cross.

The state departments of health, with the collaboration of the American Red Cross, will undertake to provide appropriate information through their own channels and through state medical societies for the medical profession and the general public in regard to the availability and use of the surplus plasma.

Medical Legislation

MEDICAL BILLS IN CONGRESS

The bill introduced by Representative Priest, Tennessee, H. R. 4512, has been favorably reported to the House of Representatives by the Committee on Interstate and Foreign Commerce to amend the Public Health Service Act to provide for research relating to psychiatric disorders and to aid in the development of more effective methods of prevention, diagnosis and treatment of such disorders.

International Health Organization

The Senate Committee on Education and Labor has reported S. J. Res. 89, with recommendation that it pass, requesting the President, on behalf of the government of the United States, to urge on the United Nations Organization the prompt convening of a conference to draw up the statutes of an International Health Organization.

Miscellaneous

H. R. 4771, introduced by Representative Morrison, Louisiana, provides for the payment of direct federal assistance to individuals permanently and totally disabled, to blind individuals and to certain individuals 65 years of age or over.

A bill introduced by Representative Mills, Arkansas, H. R. 4795, proposes to prevent the smuggling of opium and other narcotic drugs into the United States, particularly from any country where such drugs are permitted to be sold to consumers for nonmedical purposes.

Creation of a Commission on Physical Fitness for American Youth is proposed by H. J. Res. 286, introduced by Representative Weiss, Pennsylvania. This commission, it is contemplated, will investigate the need for the establishment and maintenance of a nationwide physical fitness program and will transmit its recommendations to the President. An appropriation of \$50,000 is to be authorized to carry out the purposes of the joint resolution.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Artificial Limb Research.—Research which may yield the first fundamental information on artificial limbs has been started by a team of engineers, medical experts and anthropologists of the University of California. The research will delve primarily into the fundamentals of locomotion of the normal leg and the amputated leg. The scientists hope that improved artificial limbs and operative technics which will make the limb better suited to artificial reconstruction will result. Originally planned exclusively for men in the veterans' age group, the research has been expanded to include men and women in all age groups, since statistics show a far greater number of amputations in the civilian population than among veterans. University faculty members aiding in the research are Howard D. Eberhart, associate professor of engineering, in charge; Alexander S. Levens, associate professor of engineering; Dr. John B. de C. M. Saunders, professor of anatomy; Dr. Verne T. Imman, assistant chemical professor of orthopedic surgery, and Theodore D. McCown, Ph.D., assistant professor of anthropology.

GEORGIA

Cobb Gift of Hospital.—A \$250,000 gift from Ty Cobb for the construction of a modern hospital in Royston was reported in the newspapers recently. Mr. Cobb is financing the hospital as a memorial to his parents, who were born and raised in Royston.

Changes in Health Personnel.—Dr. William B. Harrison, medical director of the Northeastern Medical Region, with headquarters in Gainesville, has been named assistant director of the division of maternal and child health of the Georgia state department of health. Dr. Harold M. Graning, San Francisco, has been assigned by the U. S. Public Health Service to serve with the state health department as assistant director of local health organizations. Mr. Thomas F. St. John, recently returned from military service, has joined the state department as information executive in the division of health education.

ILLINOIS

Personal.—Dr. Ernest O. Nay, Terre Haute, Ind., who has been secretary-treasurer of the Wabash Valley Aesculapian Society for nineteen years, was elected president of the society at its recent meeting in Danville. Dr. Harlan A. English, Danville, was elected secretary-treasurer to succeed Dr. Nay. —Dr. David W. Fey, Peoria, has been appointed fire and police surgeon of Peoria.

Chicago

New Promotions at Northwestern.—Drs. John A. Wolfer and Karl A. Meyer, both associate professors of surgery at Northwestern University Medical School, were recently promoted to professors of surgery. Dr. Wolfer, who graduated at Northwestern University Medical School in 1908, has been a member of the faculty there since 1910. Dr. Meyer, who graduated at the University of Illinois College of Medicine in 1908, has been a member of the faculty at Northwestern since 1926. He is also medical superintendent of Cook County Hospital.

Hematology Research Activities.—The Hematology Research Foundation announces that the Helen Schuman Finnerman Fund, to perpetuate the memory of a leukemia victim, will be used for the hospitalization of special patients in connection with their treatment for blood diseases. A second fund, called the Ruth Reader Fellowship in Hematology, will be used to aid the graduate student working on his Ph.D. and will stimulate interest in blood research. The latter has available \$1,500 annually, while the Finnerman Fund will include all monies collected since June 1945. The Hematology Research Foundation, organized in 1944, has a medical advisory council of seven members: Dr. Raphael Isaacs, Michael Reese Hospital, Chicago; Dr. Louis R. Limarzi, assistant professor of medicine, University of Illinois College of Medicine; Dr. Andrew C. Ivy, professor of physiology, Northwestern University Medical School; Dr. Ludvig Hektoen, Chicago Tumor

Institute; Dr. Anton J. Carlson, professor emeritus of physiology, University of Chicago School of Medicine; Dr. Italo F. Volini, formerly dean of Loyola University School of Medicine; Dr. Otto Saphir, pathologist, Michael Reese Hospital and University of Illinois. The foundation has 757 members and has raised \$16,000 for blood research.

INDIANA

Dearholt Medal Goes to Murray Auerbach.—The Hoyt E. Dearholt Medal of the Mississippi Valley Conference on Tuberculosis was awarded to Mr. Murray A. Auerbach, Indianapolis, for twenty-five years executive secretary of the Indiana Tuberculosis Association. The presentation was made at the Chicago meeting of the conference on October 9.

Personal.—Mr. Robert Yoho, who has been connected with the Indiana State Board of Health, has been appointed director of the division of health and physical education.—Dr. Paul D. Williams has resigned as medical superintendent of the Richmond State Hospital, Richmond. Dr. Otis R. Lynch, Marengo, has been appointed medical superintendent of the Richmond State Hospital to succeed Dr. Paul D. Williams, resigned.

IOWA

Operation of Blood Transfusion Service.—The State University of Iowa College of Medicine, Iowa City, will conduct a course in the operation of blood transfusion and related subjects February 4-March 2 to assist in qualifying physicians to supervise and operate blood transfusion services. The course will be conducted by Drs. Elmer L. DeGowin, assistant professor of internal medicine, and Robert C. Hardin, associate in internal medicine, who assisted Dr. DeGowin in the organization of the blood transfusion service of the University Hospitals. Additional information may be obtained from Dr. John T. McClintock, in charge of postgraduate studies, Medical Laboratories Building, State University of Iowa, Iowa City.

MASSACHUSETTS

George Minot Honored.—Dr. George R. Minot, Nobel laureate in physiology and medicine, 1934, professor of medicine, Harvard Medical School, Boston, and director of the Thorndike Memorial Laboratory of the Boston City Hospital, was honored at a dinner December 5 in recognition of his sixtieth birthday, which he observed December 2. Dr. William B. Castle, Boston, was toastmaster and speakers included Drs. Henry A. Christian, Brookline; Charles Sidney Burwell, Boston; James W. Manary, Boston; Laurence B. Ellis, Boston; Elliott P. Joslin, Boston; James Howard Means, Boston, and Francis M. Rackemann, Boston. Dr. Reginald Fitz, Boston, representing the President and the House of Delegates of the American Medical Association, presented to Dr. Minot its Distinguished Service Medal for his achievements. Dr. Minot was also presented with a bound volume of letters of greetings from numerous scientists throughout the world.

MINNESOTA

Personal.—Drs. Charles Bolsta, Ortonville, and Leonard E. Claydon, Red Wing, recently completed fifty years in the practice of medicine.—Dr. Russell R. Heim, Minneapolis, coroner of Hennepin County, has been reelected secretary-treasurer of the Minnesota Association of Coroners.

Fifty-Five Years of Practice.—Dr. Alfred E. Walker, who was 83 years of age December 3, has been practicing in Duluth continuously since 1890. Dr. Walker and his wife observed the fiftieth anniversary of their marriage last August. He graduated at Bellevue Hospital Medical College, New York, in 1890. *Minnesota Medicine*, which recently credited Dr. Alfred M. Ridgway, Annandale, as being the state's oldest practicing physician (*THE JOURNAL*, October 27, p. 642), reports that Dr. Walker ties with Dr. Ridgway in age and years of service.

Actions of State Medical Board.—Mrs. Helen Geneva Rudd, Minneapolis, was recently taken to the federal woman's reformatory, Alderson, W. Va., to serve a three year sentence which she had received in 1943. At that time she was placed on probation and ordered to the government hospital at Lexington, Ky., for treatment of drug addiction. The recent revocation of this probation and commitment to the West Virginia institution concludes a twenty year history of a drug addict and represents an activity of the Minnesota State Board of Medical Examiners in ending a long list of impositions of Mrs. Rudd in her attempt to obtain narcotics.

"Dr." John P. LeMay, also known as "Rev." John P. LeMay, and his mother, Mrs. Florence LeMay, were recently sentenced to a term of one year in the Minneapolis Workhouse following their pleas of guilty to the illegal practice of medicine. One witness testified that she had paid a sum of money to the defendants for so-called "detoxification" treatments, which consisted of an enema which lasted about an hour, "medical pills" and prescription for a diet. When arrested, LeMay had on display in his office the license to practice medicine and the basic science certificate formerly held by a Minneapolis physician who died in January 1944. Testimony revealed that Mrs. LeMay had formerly been employed as secretary of the deceased physician.

NEBRASKA

Personal.—Dr. John M. Thomas, Omaha, has been appointed a member of the Omaha School Board to complete the term of the late Dr. Claude W. Mason, who had been elected to the board for six years, the term to end in 1947.

State Cancer Society Organized.—The Nebraska Society for the Study of Cancer was organized at a meeting in the Paxton Hotel, Omaha, October 26, with Drs. Edward W. Rowe, Lincoln, as president, and Frank H. Tanner, Lincoln, secretary. The society is an outgrowth of a resolution passed by the house of delegates of the Nebraska State Medical Association at its last annual session, which recommended the organization of a cancer research society, the purpose of which will be to cooperate with the American Cancer Society.

NEW JERSEY

Personal.—Dr. Bradford Craver, instructor in pharmacology, University of Rochester School of Medicine and Dentistry, has joined the department of pharmacology, research division, Ciba Pharmaceutical Products, Lafayette Park, Summit.

Library Dedicated to Physician.—Dr. Samuel B. English, for many years medical director and superintendent of the New Jersey Sanatorium for Tuberculous Diseases, Glen Gardner, was honored October 6 when the sanatorium's new library was dedicated to him.

Oil Company Inaugurates Research in Toxicology.—Dr. Joseph P. Holt, formerly associate professor of physiology at the University of Louisville School of Medicine, has joined the medical department of the Standard Oil Company as a specialist in toxicology. He will be responsible for original research in the biologic effects of toxic substances. Dr. Holt will also act as consultant and adviser to the company committee, representing all phases of the company's operation, which is charged with the elimination of potential hazards to workers. With the establishment of this branch of its medical department, Jersey Standard announces that it is the first oil company to undertake its own work in this field. Previously, research has been conducted in outside institutions and laboratories. Dr. Holt graduated at Louisville in 1936. He had been a member of the staff there since 1937.

NEW YORK

Personal.—Dr. Leslie H. Wright has resigned as superintendent of the Genesee Hospital, Rochester. —Dr. Lewis J. Graham, Corning, has been appointed medical director of Corning Glass Works, Corning, filling the vacancy that occurred when Dr. Willis C. Templer died last May. —Dr. Exie E. Welsch, formerly director of the Rochester Guidance Center, has been appointed psychiatrist on the staff of the Bureau of Child Guidance, New York City Board of Education.

New York City

Victory Meeting on Health.—A victory meeting of the Public Health Association of New York City in collaboration with the American Public Health Association was held at the Hotel Pennsylvania, New York, December 13-14. The program was devoted to discussions on environmental sanitation, public health in New York City in 1945, health education, training and recruitment, the war's influence on public health, public health problems highlighted by the war, medical service plans, newer emphasis in public health and what's new in school health.

Annual Report of Research Institute.—The annual report of the Public Health Research Institute of the City of New York, Inc., for the year ended June 30 has recently been made available. The report discusses the activities carried on in the institute during the year and announces that an agreement has been reached between the city of New York and Columbia University providing for a building containing at

least 50,000 square feet of laboratory space for the use of the Public Health Research Institute in a proposed research-teaching hospital center. In addition, a 50 bed unit is to be provided in the hospital for use by the institute for the study of disease.

Research Fund Named for Maurice Lewi.—To honor Dr. Maurice J. Lewi on his eighty-eighth birthday, December 1, the Maurice J. Lewi Research Fund, Inc., has been created "to be utilized for research and kindred purposes in connection with the medical sciences, with special attention to as yet unsolved problems in that branch of the healing art known as podiatry (chiropody)." Dr. Lewi graduated at the Albany Medical College in 1877. He has served as professor of medical jurisprudence at the Albany Law School and lecturer at the Albany Medical College. He has also served as president of the first Institute of Podiatry, the Foot Clinics of New York and the Albany County Medical Society. For twenty-one years he was secretary of the New York State Board of Medical Examiners.

Hall of Residence and Alumni Hall.—Two special features figure prominently in the proposed New York University-Bellevue Medical Center, one a Hall of Residence and one an Alumni Hall. The Hall of Residence will cost \$750,000 and will comprise ten stories to contain 279 rooms and private living quarters for New York University medical students unable to reside at home who must now find quarters in the scattered boarding houses of the neighborhood. The Alumni Hall will be an auditorium, will cost \$500,000 and when completed will be large enough to accommodate all the undergraduates. It will form an individual unit at the heart of the new center and will join the main college and hospital building on one side and the Hall of Residence on another. Campaigns are now under way to raise funds for both units. The entire project with these units and other proposed additions will cost about \$27,500,000. The university's share will be \$15,000,000. The city will spend \$12,500,000 to rebuild its present Bellevue Hospital area, which will join the university's new building along First Avenue. The combined project will cover the nine city blocks between 25th and 34th streets, First Avenue to East River Drive. The university's buildings will occupy a four block area bounded by East River Drive, 30th Street, First Avenue and 34th Street—the section immediately north of the present Bellevue area. The city's new Bellevue development will extend from 25th to 30th streets and from First Avenue to East River Drive. The university section will include a new college of medicine building, a university clinic, a 480 bed university and an Institute of Forensic Medicine, the last mentioned to be the first of its kind in the world and to be built by the city on land to be provided by New York University. Members of the university faculty will staff it. In addition other units will be the Hall of Residence and the Alumni Hall. There will be six institutions housed in New York University structures. One H shaped building to cost \$8,500,000 will be nineteen stories and contain the clinic on the ground floor, the college of medicine above that and, superimposed on them both, a fourteen floor hospital.

NORTH DAKOTA

Personal.—Dr. Mary E. W. Soules, Dickinson, was recently appointed director of the southwest district health unit with temporary headquarters in New England. The unit comprises the counties of Slope, Bowman, Golden Valley, Billings, Hettinger and Adams.

Membership of State Medical Board.—Dr. Charles W. Schoregge, Bismarek, is president of the North Dakota State Board of Medical Examiners and Dr. George M. Williamson, Grand Forks, secretary-treasurer and general administrative officer. Other members of the board include Drs. Frederick W. Fergusson, Kulm; Cyril J. Glaspel, Grafton; Olafur W. Johnson, Rugby; William H. Long, Fargo; Archibald D. McCannel, Minot; Frederick L. Wicks, Valley City, and Willard A. Wright, Williston.

OHIO

Personal.—Wirth Howell has been named acting director of the Cleveland Child Health Association. Dr. Richard A. Bolt, Cleveland, resigned as director early this year to assist in the organization of the new school of public health at the University of California, Berkeley (THE JOURNAL, June 30, p. 678). —Dr. Eugene E. Elder, Massillon, has been appointed head of the Youngstown Receiving Hospital for Mental Cases, succeeding Dr. C. Herbert Cronick, who resigned recently. (THE JOURNAL, September 29, p. 371). —Dr. George T. Bly-

denburgh, director, student health service, Ohio Wesleyan University, Delaware, is the new secretary-treasurer of the American Student Health Association.—Dr. Jacob B. Moses Sr., Crestline, celebrated his fiftieth anniversary as a practicing physician on July 20.—Dr. and Mrs. Lucius W. Prichard, Ravenna, on October 19 observed their fiftieth wedding anniversary.

Academy of Medicine Lectures.—Lectures to be held during 1946 by the Academy of Medicine of Cincinnati include the following:

- Dr. Bruce K. Wiseman, Columbus, January 8, The Spleen and Blood Formation.
- Dr. Hiram H. Merritt, Cambridge, Mass., January 22, The Treatment of Epilepsy.
- Dr. Milton J. E. Senn, New York, February 5-6 (The B. K. Rachford Lectures, subjects not announced).
- Dr. Edmund H. Botterell, Toronto, Canada, February 19, Diagnosis and Treatment of Injuries to the Brain and Spinal Cord.
- The Roger Morris Lecture, March 5 (speaker to be announced).
- Dr. Sumner L. S. Koch, Chicago, March 19, Injuries of the Nerves and Tendons of the Hand.
- Dr. Charles A. Janeway, Boston, April 2, Studies on Clinical Uses of Plasma Protein Fractions.
- Dr. Harold G. Wolff, New York, April 16, Reactions of the Nasal Mucous Membranes and the Stomach Engendered by Emotions.
- Dr. Frank H. Lahey, Boston, May 7, The Management of Lesions of the Terminal Ileum, Colon and Rectum.
- Dr. Walter L. Palmer, Chicago, May 21, The Nature and Treatment of Peptic Ulcers.

OREGON

Personal.—Dr. Dorothea H. Scoville, formerly of New London, Conn., U. S. Public Health Service, has resigned as health officer of Clatsop County to take charge of the maternal and child health work in Richmond, Calif.

New Fellowship in Endocrinology.—The Schering Corporation, Bloomfield, N. J., has created a research fellowship in endocrinology at the University of Oregon Medical School, Portland. The grant of \$3,000 for one year's research on gonadotropic hormones is under the direction of Dr. Carl G. Heller, associate professor of physiology and medicine.

PENNSYLVANIA

Philadelphia

First Report of Health Maintenance-Cancer Prevention Clinics.—In the first twelve months of operation of the health maintenance-cancer prevention clinics in Philadelphia, sponsored by the International Cancer Research Foundation, 2,552 persons were examined, 350 of whom were men. Of this total 1,838 were referred to their physicians for care, and 18 who were unable to afford a personal physician were referred to clinics. To obtain a check on the cancer incidence of those patients referred to physicians, letters were sent to 1,148 physicians, all but 91 of whom replied. The reports indicated that 248 examinees failed to see their physicians; 11 of those examined reported a history of cancer in the family. Of malignant disease there were 14 cases, 2 in men (chondrosarcoma of the right ileum and carcinoma of the prostate gland), 12 in women (3 epitheliomas of the skin, 2 carcinomas of the breast, 2 carcinomas of the cervix, 2 carcinomas of the fundus uteri, 1 carcinoma of the gallbladder, 1 carcinoma of the forehead and left tragus and 1 case of abdominal carcinomatosis). Of the many and varied findings may be noted lesions of the cervix 795, cardiovascular diseases 545, skin lesions 406, hemorrhoids 393, benign tumor 253, cystoceles 221, rectoceles 201, ncvi 157, genitourinary disturbances 144, obesity 112, hernias 59, prostatic disturbances 55, vaginitis 67, anemias 28, pulmonary tuberculosis 7 and aortic aneurysm 1. Teeth required attention in 102 cases, the feet in 441. Mildred W. S. Schram, Ph.D., secretary of the International Cancer Research Foundation and director of the clinics, has at the request of representative medical groups visited Princeton, N. J., Erie, Pa., New Orleans, Houston, Texas, and some cities in northern California to discuss legal problems and help with the arrangements for establishing such examining centers as those created in Philadelphia (THE JOURNAL, Aug. 26, 1944, p. 248). In her report Dr. Schram states that there is a clinic in Pittsburgh which is almost one year old and that the New Orleans Parish Medical Society has passed a resolution requesting six hospitals to organize clinics. The Massachusetts State Department of Health plans to have one in connection with each of its tumor clinics throughout the state, the first of which was said to be organized in Fall River last spring. The Philadelphia clinics are held at the following hospitals: Hahnemann, Jeanes, Jefferson, Jewish, Lankenau, Pennsylvania, Temple, University of Pennsylvania and Woman's Medical College.

TENNESSEE

Grant for Research.—A grant has been made by Sharp and Dohme, Inc., Glen Olden, Pa., to the department of bacteriology of the University of Tennessee, Knoxville, for a study of sulfonamide drugs in the control of fowl typhoid infection, according to *Science*. The investigation will be conducted by Darlington F. Holtman, Ph.D., professor of bacteriology and head of the department.

New Head of Department of Urology.—Dr. Thomas D. Moore, Memphis, has been appointed professor and head of the department of urology at the University of Tennessee College of Medicine, Memphis, effective December 1. Dr. George R. Livermore, who has been head of the department of urology since 1916, has asked to be relieved of his responsibilities as head of the department. His resignation has been accepted, but he will continue as a professor after a temporary leave of absence.

TEXAS

Dormitory Named for Physician.—The dormitory of Baylor University was recently redecorated and renamed for Dr. John T. Harrington, Waco, since 1932 chairman of the board of trustees at Baylor University. The dormitory will be known as Harrington Hall. Dr. Harrington has practiced medicine sixty-six years and has been associated with Baylor as official physician and as a member of the board of trustees for many years.

Dallas Clinical Conference.—The fifteenth annual spring clinical conference of the Dallas Southern Clinical Society will be held at the Hotel Adolphus, March 18-21, 1946. A preliminary program includes the following speakers:

- Dr. Charles A. Doan, Columbus, Ohio, Medicine.
- Dr. Jacob A. Barger, Rochester, Minn., Gastroenterology.
- Col. John C. Woodland, M. C., Fort Sam Houston, Military Medicine.
- Dr. Alfred Blalock, Baltimore, Surgery.
- Dr. John S. Lockwood, New Haven, Conn., Surgery.
- Dr. Richard H. Sweet, Boston, Surgery.
- Dr. Charles B. Huggins, Chicago, Urology.
- Dr. Joe V. Meigs, Boston, Gynecology.
- Dr. Donovan J. McCune, New York, Pediatrics.
- Dr. Edmund B. Spaeth, Philadelphia, Ophthalmology.
- Dr. Albert C. Fursenberg, Ann Arbor, Mich., Otolaryngology.
- Dr. William H. Sebrell Jr., Washington, D. C., Basic Science.
- Dr. Ira H. Lockwood, Kansas City, Mo., Radiology.

Additional information may be obtained from the secretary of the Clinical Society of the Dallas Southern Clinical Society, 433 Medical Arts Building, Dallas 1, Texas.

GENERAL

National Noise Abatement Council.—At the annual meeting of the National Noise Abatement Council in New York recently Paul J. Washburn, New York, was elected president. Allen Wilson, Chicago, past president of the Greater Chicago Noise Reduction Council, was elected vice president and appointed chairman of a committee to develop a peacetime program designed to reduce needless noise in home, street and factory.

Visitors to the United States.—Two representatives of the Industrial Health Research Board of the British Medical Research Council, Dr. Donald Hunter, physician to the London Hospital and director of its department of research in industrial medicine at the hospital, and Mr. R. S. F. Sehillng, secretary, industrial health research board, are studying industrial health activities in the United States. They visited the Council on Industrial Health of the American Medical Association.

Macy Foundation Discontinues Reprint Service.—The War Reprint Service of the Josiah Macy Jr. Foundation will be discontinued by January 1. The reprint service of the foundation has been an effort to bring new and important developments in the science and practice of medicine to medical officers who were largely cut off from the sources of medical information during the war. In the selection of these articles the foundation has had the active cooperation of the committee on pathology of the National Research Council and of the National Committee for Mental Hygiene.

Psychiatric Personnel Placement Service.—Capt. Forrest M. Harrison (MC) has been named director of a newly established psychiatric placement service to function under the auspices of the American Psychiatric Association of the National Committee for Mental Hygiene. The service is designed especially to help physicians and psychiatrists make contacts with training opportunities such as residencies, postgraduate courses and fellowships and to aid institutions in locating suitable candidates for appointments. Physicians interested in psychiatry are invited to send in full biographic state-

ments including personal data, education, training, experience and special desires in order that this service may be of the greatest possible assistance to them. Deans of medical schools, superintendents of hospitals and directors of industrial organizations, clinics, and others employing or participating in the training of psychiatric personnel, are invited to submit full information regarding available positions and courses, including financial details. Foundations, universities and other agencies are asked to report pertinent fellowships in psychiatry, psychosomatic medicine and child guidance. Inquiries should be addressed to Capt. Forrest M. Harrison (MC), National Committee for Mental Hygiene, 1790 Broadway, New York 19.

Insurance Research Fund Starts Operation.—The Life Insurance Medical Research Fund announces that applications for grants may now be made to support fundamental research bearing on cardiovascular disease, including rheumatic fever, hypertension, arteriosclerosis and allied disorders. Funds will become available after January 1, and grants will be made for varying periods of time with the specific requirements of the research problems. Applications for grants may now be made to the chairman of the advisory council and should be transmitted in duplicate through the administrative officer of the institution making application. Requests for grants should include a description of the proposed research, a budget and the date when funds are desired. Applications received by February 1946 will be given consideration at a meeting of the advisory council to be held on or about March 1, 1946. The creation of the research fund was sponsored by the American Life Convention and the Life Insurance Association of America. One hundred and forty-six life insurance companies in the United States and Canada are cooperating in the Life Insurance Medical Research Fund. An advisory council of eight members was created (*THE JOURNAL*, August 11, p. 1118) and a committee of four physicians was named to the council. Dr. Francis G. Blake, chairman of the advisory council, which will assist the board of directors of the fund in making grants, may be addressed at Yale University School of Medicine, 333 Cedar Street, New Haven 11.

FOREIGN

Manufacture of Penicillin in India.—The government of India has under consideration the appointment of a committee to advise the government on the steps to be taken to manufacture penicillin in India, it is reported.

Baly Medal.—The Baly Medal of the Royal College of Physicians, London, has been awarded to Professor August Krogh of the Zoophysiological Laboratory at Copenhagen, according to *Science*. Dr. Krogh was awarded the Nobel prize in physiology and medicine in 1920.

Personal.—At the request of the Yugoslav Ministry of Health and the army general staff, Sir Harold D. Gillies has recently arrived at the Belgrade airport from England to work with the UNRRA mission. He was to remain in Yugoslavia several days to acquaint local doctors with the latest developments in repair of bodily disfigurements caused by war, accident and disease. He will leave behind several working teams of plastic surgeons trained by him to conduct practical demonstrations in plastic surgery in other areas.

Ernest Sauerbruch Dismissed as Chief of Berlin Health Service.—The four military governors of Berlin voted unanimously October 11 to dismiss Dr. Ernest F. Sauerbruch, Berlin, from his post as chief of the Berlin Public Health Service, the *Chicago Sun* reported. It was stated that Sauerbruch never had been a member of the Nazi party but had been an early admirer of Hitler. The *Sun* stated that the action of the military governing body set something of a precedent. "He prospered under the Nazis and received a position of prominence, whereby his position directly and indirectly contributed to the prestige of the Nazi party." It was indicated that Sauerbruch may still be arrested. Meanwhile his services will be used in a position without administrative authority at the Berlin Charity Hospital, it was stated.

Commission Named to Study Medical Needs in Poland.—Johannes H. Bauer, New York, of the International Health Division of the Rockefeller Foundation, is on loan to the Red Cross to be one of a three member commission to tour Poland to ascertain "prime needs for the \$1,000,000 tentatively earmarked for relief work." According to the *New York Times* the UNRRA, which is bringing in food and clothing, has altered the relief problem, shifting the Red Cross emphasis to medical assistance. The *Times* stated that Poland's health and medical service is broken down completely, but the six thousand doctors that the country has left

of a prewar total of thirteen thousand are struggling "valiantly" to control disease. It is estimated that 70 per cent of Poland's hospitals and clinics were destroyed. Medical records of the UNRRA show that 12,000 cases of typhus, 22,000 of typhoid, 3,400 of dysentery, 6,000 of scarlet fever and 6,500 of diphtheria were reported in Poland up to the end of August. Last week 32,100 new cases of typhoid alone were reported. Doctors say that there are at least 1,000,000 cases of venereal disease.

Proposed Medical Center at American University of Beirut.—Plans for the construction of a medical center at the American University of Beirut, Lebanon, at the estimated cost of \$2,500,000 were announced November 17 by Albert W. Staub, American director of the Near East College Association. The board of trustees of the university has approved the project. The building will have four main wings and two cross wings and will increase the bed capacity by more than 250 per cent, making possible the training of 25 per cent more medical students. As a teaching hospital the building will contain classrooms in conjunction with clinical work, administrative offices, living quarters for interns, staff suites, rooms for the nursing staff and guest rooms. Each service will have its own operating rooms. Nurseries will be designed in the most modern way, with no more than 8 bassinets to a room. Air conditioning will be provided for all operating suites and for private and semiprivate rooms. In the summer, humidity will be controlled throughout the hospital. The American University of Beirut, one of the eight colleges affiliated with the Near East College Association, was founded in 1866 with a charter from the state of New York. Its medical school opened a year later. Work is expected to start on the new building this coming spring.

Government Services

Disposition of Meyerhof's Library

The *Army Medical Library News* announces that collections of the late Dr. Max Meyerhof of Cairo, totaling 10,000 volumes on ophthalmology and ancient Egyptian medicine, were given to the libraries of Fouad I University, Cairo, and Farouk I University, Alexandria. The Army Medical Library has secured from another source an almost complete collection of Dr. Meyerhof's work. This collection includes manuscript materials by Dr. Meyerhof, some of which are unpublished, and also a number of writings about Dr. Meyerhof and his work. A recent photograph of Dr. Meyerhof has been received as a gift of Dr. Henry R. Viets, Boston, to the portrait collection.

Woman Scientists Retire from Public Health Service

Ida A. Bengtson, Ph.D., and Alice C. Evans, Sc.D., were guests of honor at a dinner at Washington recently given in recognition of their retirement after many years of service with the National Institute of Health, U. S. Public Health Service. Dr. Bengtson's retirement will be effective January 1, ending twenty-nine years' service with the institute. Dr. Evans retired October 1, concluding thirty-five years' service. Dr. Evans of Health, Pa., identified undulant or Mediterranean fever in 1923. Twenty-two years ago, during the course of her laboratory work, she contracted the fever and, although suffering from recurrent attacks, has continued her experiments. By her persistent research she succeeded in tracing the disease to blooded goats which had been imported to the United States from the Mediterranean. Her studies proved also that undulant fever and the disease in cattle in the United States known as Bang's disease are caused by identical germs. Dr. Bengtson of Harvard, Neb., prepared, during 1935-1936, the standard for gas gangrene toxins and antitoxins. This is the standard used by the League of Nations Health Committee in Copenhagen, Denmark. Following this work, Dr. Bengtson was detailed to study the virus of trachoma at the Missouri Trachoma Hospital. During subsequent research in endemic typhus she became ill with this disease while inoculating rats for study purposes. She contributed to the early studies of the cause and prevention of food poisoning in canned foods, and for the past ten years she has been devoting herself to work in rickettsial diseases.

Foreign Letters

LONDON

(From Our Regular Correspondent)

Nov. 25, 1945.

The Socialist Government and the Medical Profession

The intransigent attitude of the socialist government toward the efforts of its predecessor to come to an agreement with the representatives of the medical profession on the projected national health service seems to be considerably modified. Having made political capital out of the negotiations by denouncing them as "a surrender to the doctors," the present government is now following the same path. By direction of the council of the British Medical Association the secretary, Dr. Charles Hill, wrote to the minister of health, Mr. Bevan, expressing the desire that the representatives of the medical profession should be fully consulted before legislation for a national health service was introduced. Mr. Bevan replied that he would be happy to meet the negotiating committee of the profession before the government finally decides what proposals it will submit to Parliament. At the annual conference of local medical and panel committees, held at the House of the British Medical Association, considerable concern was expressed at the failure of the minister of health to give any indication that he proposed to enter into negotiations with the medical profession before introducing his new health services bill. The reading of his reply to Dr. Hill therefore gave much satisfaction.

Research on Aging

In 1939 a Club for Research on Aging was established in this country. As the name indicates, it consisted of workers engaged in research and was not a medical society in the ordinary sense of the word. There are branches of the club in Britain, the United States, France and Argentina. At present there are only 75 members in the club. The Nuffield Foundation has generously supported a plan for research work, which is being conducted at one of the hospitals of the London County Council. At the end of 1944 Lord Nuffield made a donation of \$15,000 to establish an experimental laboratory, the Gerontological Research Unit, which is at present housed in the Departments of Zoology and Physiology of Oxford University. The American branch of the club has already done important work, which includes a museum of senile tissues, clinical research on the effects of vitamins on old persons at Elgin Hospital and the publication of the *Journal of Gerontology*.

Mr. James Sherren: The Surgeon Who Went Back to the Sea

Mr. James Sherren, consulting surgeon to the London Hospital, who has died at the age of 73, had a remarkable career. Born at Weymouth by the sea, he had an inborn love for ships, went to sea and served before the mast. But after a hard and testing experience he suddenly left the sea for the study of medicine at the London Hospital. After a distinguished career he qualified at 27 and was elected to the surgical staff of the hospital in 1902. At this time abdominal surgery was rapidly advancing and he quickly attained a foremost position in this branch. He also did pioneer work with Head on the peripheral nervous system and published an important monograph entitled *Injuries of Nerves and Their Treatment*. During the war of 1914-1918 he was consulting surgeon to the War Office and did much work in military hospitals. He became a member of the senate of London

University and seemed on the way to the highest honors, when he suddenly retired from practice and went back to the sea in the capacity of a ship's medical officer. He was then only 54 and at the height of his career as a surgeon with the possibility of many active years as a leading surgeon before him.

Honor for an American Scientist

The Copley medal of the Royal Society has been awarded to Dr. O. T. Avery for his success in introducing chemical methods in the study of immunity against infective diseases. Dr. Avery, who was elected foreign member of the society last year, is a research fellow of the Rockefeller Institute in New York.

PARIS

(From Our Regular Correspondent)

Nov. 22, 1945.

French Association of Surgery

The forty-eighth Congress of the French Association of Surgery was held in Paris in October, with a large number of French and foreign surgeons attending. This meeting was scheduled to be held in 1939 but had to be postponed because of the war and the German occupation. The present report includes some of the subjects discussed.

THYROTOXICOSIS

For this condition Petit-Dutaillis recommended subtotal thyroidectomy. He reserves medical and physical therapeutic treatment for light, acute forms of the disease and for post-operative relapses. Thyroidectomy should be performed in one or in two stages. He then summarized the 237 cases which he had observed for periods varying from one to nine years. From 80 to 90 per cent of the patients resumed their normal life. Relapses occurred in less than 10 per cent and were ameliorated by radiotherapy. With a series of films, Velti of Paris presented his experience on 5,000 patients with thyrotoxicosis on whom he operated in two stages with an interval of three months. He stressed the importance of technical details. Fontaine and Miss Oswald of Strasbourg reported the 65 thyrotoxic goiters operated on from 1940 to 1944 by subtotal thyroidectomy in a single operation and under local anesthesia. Of 58 patients, 1 is dead. Among 7 other patients operated on in the state of asystolia, there were 2 deaths and 5 recoveries. Arterial tension was transiently modified after the operation; hypertension completely disappeared in only 1 case.

Petit-Dutaillis emphasized the part of thiourea and its derivatives and of aminothiazole in the preparation of serious cases for operation but pointed out the accidents due to this chemotherapy. However, at the recent congress of the French Association for the Advancement of Science Bovet emphasized that the treatment of thyrotoxicosis by aminothiazole was innocuous in 100 cases treated. As for acute postoperative crisis Petit-Dutaillis emphasized the part of thyroxin administered immediately after operation. Moor of Brussels believes that thyroxin gives transient results. Delannoy of Lille presented a report on 400 cases with operation in two stages. He practiced the total operation on the right side and the subtotal on the left. He did not operate on 22 seriously ill men, using radiotherapy and medical treatment. He was successful in treating a young woman patient with thyroid grafts after failure following an operation on the sympathetic (Leriche's method). To prevent postoperative myxedema Peycelon of Lyons, as well as Leriche, advised against total thyroidectomy and recommended retaining part of the sound gland. Arnaud of St. Etienne does not remove the isthmus, where, in his opinion, the sound tissue lies.

FUNCTIONAL RESULTS OF BILIODIGESTIVE ANASTOMOSIS

Mallet-Guy of Lyons pointed out that for the last forty years the good results of gallbladder anastomosis have been recorded in France; cholecystogastrostomy was more successful than cholecystoduodenostomy. Bachy and Lenoir presented 7 cases of gastrocholecystostomy for cancer of the pancreas with 2 deaths and 5 survivals. Mallet-Guy dealt with the discussion between the surgeons of Paris and those of Lyons concerning cholecystoduodenostomy in cholelithiasis. The surgeons of Lyons consider it a simplification in serious cases, especially since it leads to a quick recovery, often in eight days. Bachy and Lenoir presented 7 cases of secondary anastomosis, of which 2 were fatal, associated with biliary fistula after external drainage.

ORTHOSTATIC DISEASES AND SURGERY

Constantini of Algiers explained that orthostatic phenomena occur in patients with varicose veins and with cardiac insufficiency. These changes, he believes, are due to a redistribution of blood volume, which, depending on the patient's position, is directed either toward the lower extremities or toward the heart, which then becomes dilated. Clinically there is a sensation of vertigo or anguish with variable pulse and blood pressure. Extensive saphenectomy removes these disorders.

TREATMENT OF HALLUX VALGUS

Vallet of Paris proposed a technic which avoids the pain and the ankylosis: resection of a large part of the phalanx, reduction of the metacarpal head to a cylinder appropriate to the dimensions of the phalanx with a large fibrous interposition.

EXTRA-PLEURAL PNEUMOTHORAX

Le Foyer and Delbec of Paris reported 450 cases of extra-pleural pneumothorax performed in the surgical treatment of pulmonary tuberculosis over an eight year period. Hemorrhagic or suppurative complications were exceptional.

TREATMENT OF ABSCESSES OF THE BRAIN

Ferey of St. Malo explained Clovis Vincent's technic for ablation of an abscess of the brain. At first all possible antibacterial substances are used and one waits for six to eight weeks, carefully watching the general condition of the patient. The abscess becomes walled off, and then at operation the whole abscess with its capsule is removed in the same way as an aseptic tumor.

NEW TECHNIC OF RENAL SURGERY

Heitz-Boyer of Paris illustrated with films a technic of renal surgery by which complete removal of very large kidneys is possible. He employs a large ileolumbocostal incision and excises the whole of the twelfth rib.

A New Antibacterial Substance: Subtiline

In 1897 Metchnikoff, whose birth centenary was recently commemorated by an exhibition at the Pasteur Institute, found that *Bacillus subtilis* acts on the tetanic and diphtheritic toxins by destroying their toxic power. On May 8 at the Académie de médecine Jean Ramon, G. Ramon and Richou stated that they have succeeded in determining the antibacterial power of the filtrates of this saprophyte. They prepared a culture medium of vegetable substances with bran as a base. The filtrates obtained are comparatively rich in proteose and have gelatinolytic and bacteriostatic properties. The filtrates are bactericidal and bacteriolytic for the bacillus of diphtheria, the Preisz-Nocard bacillus, the anthrax bacillus, the coccobacillus of pseudotuberculosis and Cliga's dysentery bacillus. The active substance of the filtrate, called subtiline, is now being extracted in a concentrated and purified form with a view to its clinical application.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, Nov. 12, 1945.

Intra-Arterial Injection of Penicillin

THE JOURNAL in its July 14 issue published an article on intra-arterial injection of penicillin for infections of the extremities. This method has been widely and successfully employed in São Paulo at the Sanatório São Lucas by Dr. Eurico Branco Ribeiro, according to his article published in August 1944. He proposed the use of penicillin by arterial puncture in infections of the extremities. This method is indicated in aente osteomyelitis, phagedena, panaris and pyogenic arthritis. In order to prolong the therapeutic influence of the penicillin a venous tourniquet can be applied for twenty to thirty minutes. The arterial puncture—in the femoral or in the humeral artery, according to the site of the lesion—can be made once or twice a day for a fortnight without injury to the artery. Dr. Eurico Branco Ribeiro injected 3 to 5 cc. of a solution of penicillin, i. e., 15,000 to 25,000 units of the drug. The injections were well tolerated by the patients. The pain decreased rapidly and healing occurred in a shorter time than with any other treatment. Dr. Eurico Branco Ribeiro emphasizes the safety of the method, its simplicity and the good results obtained.

Cervical Polyps and Polypoid Disorders of the Cervix

Dr. Licinio Dutra was awarded the "Honorio Libero Premium" conferred annually by the Paulista Association of Medicina. In his monograph, Dr. Licinio discusses cervical polyp and polypoid disorders of the cervix. He describes the simple mucous polyp of the cervix and its structural modifications as well as polypoid disorders of the cervix, which macroscopically appear to be simple mucous polyp. He devotes a special chapter to the discussion of gynecologic disorders accompanying cervical polyps which gynecologists should recognize in order to treat them correctly. Dr. Licinio emphasizes the necessity for microscopic examination of all cervical polyps, because of their varied structure. A cervical polyp should be completely extirpated and the site of implantation destroyed by electrocoagulation. If microscopic examination reveals syphilis, tuberculosis, carcinoma or sarcoma the treatment must be correspondingly different. With reference to his own experiences and those of other authors he discusses the problems of early diagnosis of carcinoma of the cervix and squamous metaplasia of a mucous polyp. Dr. Licinio considers the latter a precancerous condition, particularly when associated with irritant agents.

Pemphigus Foliaceus

A large new pavilion for women has been opened at the Hospital for Pemphigus Foliaceus ("wildfire"), a disease prevalent in the interior of the state of São Paulo. Dr. João P. Vieira, director of the special service of pemphigus foliaceus, reported that the hospital capacity has been increased from 60 to 150 beds, and many improvements have been introduced which will help in the campaign against this dreadful disease.

The Association of Thiamine Hydrochloride and Mono-Io-Phenil

The object of Dr. Cândido Botafogo's recent experimental work was to ascertain whether thiamine hydrochloride undergoes alteration in the presence of mono-io-phenil, a salt composed of organic iodine and aminopyrine, or whether it retains all its biologic properties. The possibility of the oxidation of thiamine hydrochloride and its transformation into thiochrome, rendering it inactive in the treatment of multiple neuritis, is well known. The tests carried out by the author were based on the cure of polyneuritis in pigeons (Kinnersley-Peters) and in

rats (M. J. Smith). Dr. Cândido describes the principal technic in the processes mentioned. Some animals with induced thiamine hydrochloride deficiency were injected with the substance to be tested and others received the control substance. It was found that with the two solutions an identical response was obtained from the animals under observation. Dr. Cândido Botafogo concludes that thiamine hydrochloride retains its properties satisfactorily in the presence of mono-*o*-phenil when present in the dose indicated in the solution tested.

Brief Items

Dr. Samuel Leão de Moura, director of the Public Health Laboratory of the city of Santos, São Paulo, has recently published a report concerning schistosomiasis *mansonii* discovered by him in the district of Sabão. Dr. Moura has examined the feces of 1,126 persons of this district and found 113 positive cases (9.1 per cent). The disease until now has not occurred in the city and probably was imported from northeastern Brazil through commercial exchanges between the main port of the state and that region, where the infection is highly prevalent. The drastic measures that have been taken to control the spread of the disease have been fully approved by Dr. Cesar Pinto, a specialist of the Oswaldo Cruz Institute of Rio de Janeiro, who has just visited the city of Santos.

This month at São Paulo the Paulista Association for the Study of Industrial Medicine was organized. Dr. Borges Vieira, professor at the School of Public Health of the University of São Paulo, was elected president of the society.

Dr. Antonio C. Camargo, professor emeritus of medicine at the University of São Paulo, recently addressed the Paulista Medical Association on the "Councils of Medicine" created by a recent decree of President Getulio Vargas. Dr. Camargo reminded the association that these councils would have represented an improvement in the practice of medicine in Brazil if the decree had followed the main lines of the bill introduced in 1937 in the Brazilian congress at the request of the leading medical societies. Nevertheless the decree of President Vargas has treated the subject merely as a punitive measure which was expected to be used as a political weapon against physicians at a time when Brazil is hoping to have fair elections for president and for congress. As an old and mature practitioner of medicine, Dr. Camargo declared that he was against the organization created by the Vargas decree.

Personal

Dr. Italo Sciascia, associate professor of medicine at the Paulista School of Medicine, has left for the United States at the invitation of Dr. Thomas I. Price of New York to work for some time at one of the hospitals of that city.

The São Paulo Association of Medicine and the São Paulo chapter of the Brazilian College of Surgeons have recently held a joint meeting to honor the memory of Dr. Sergio Paiva Meira, anatomist and surgeon, who was one of the leading professors at the University of São Paulo. At this meeting Dr. Sebastião Hermeto, Dr. Eurico S. Bastos and Dr. Orlando Aida spoke in praise of the medical achievements of the late Professor Meira.

Dr. João Bicudo Junior, associate professor of dermatology at the University of São Paulo and past president of the Section of Dermatology of the Paulista Medical Association, has been appointed head of the outpatient department of the Division of Dermatology and Syphilology of the Santa Casa Hospital. Dr. Bicudo succeeds Dr. Aguiar Pupo, a leading dermatologist of this city.

Dr. Ciro Rezende, ophthalmologist, of São Paulo, has been elected member of the local chapter of the Brazilian College of Surgeons. Dr. Rezende is associate professor of ophthalmology at the University of São Paulo.

SWITZERLAND

(From Our Regular Correspondent)

GENEVA, Nov. 14, 1945.

Mental Hygiene in Switzerland

There is a great increase in interest in Switzerland toward all questions of mental hygiene. In many towns, offices called "Offices médicaux pédagogiques" have been created to assist the "problem child." A series of lectures is given annually by the Institute of the Sciences of Education of the University of Geneva. The last series was specially concerned with the problem of intelligence. Dr. Brantmay spoke on the importance of intelligence and how great a problem it is in mental hygiene. Dr. F. Rilliet, the Geneva school doctor, spoke on the illnesses that could endanger the intellectual development of children. Professor G. de Morsier gave a lecture on "intelligence and the brain" and Professor F. Morel, director of the psychiatric clinic of Geneva, spoke on intelligence in psychiatry.

Swiss Physicians for the Current Year

Medical students in Switzerland at present total 2,608. Of these 2,295 are Swiss and 313 are foreigners. Students who have just graduated number 233, of whom 34 were women. The total number of Swiss doctors is 4,073, to which can be added 1,443 assistants. There is 1 physician for 1,171 inhabitants. In a town it amounts to 1 physician for 668 inhabitants. Of the total number of physicians 1,634 are specialists. There are now 142 physicians in practice who are between 71 and 75 years of age, 66 physicians who are between 76 and 80 years of age, and 26 who are more than 81. In 1938 the figures were 100, 38 and 16 respectively for these older age groups.

Medical Consultative Commission of International Red Cross

The Medical Consultative Commission of the International Red Cross Committee, composed of physicians and one nurse, was created in 1943 with the aim of centralizing medical data coming from all countries, particularly those concerning the medicaments and sanitary material. It also provided help of medical or prophylactic character to the officers of prisoner of war or civil internec camps. From numerous national organizations this commission receives important documentation on the health conditions of the world population, on the different illnesses and on the development of epidemics. It encourages the numerous national Red Cross organizations to create qualified medical personnel. It has organized special courses for Swiss physicians on the prophylaxis and the campaign against numerous epidemics. In Switzerland 198 physicians, 211 nurses and 69 technicians are at the disposal of the commission. Thus a specialized personnel from a neutral country can start immediately to an epidemic area, collect the necessary data, give prompt advice as to what methods of help can be used and transmit as quickly as possible the necessary material from the stocks of the International Red Cross Committee.

Marriages

ARNOLD JOSEPH CERASOLI, New York, to Miss Concettina Yolanda Magri of Mount Vernon, N. Y., November 10.

JAMES T. CARROLL, Fulton, N. Y., to Miss Lucille Jeannette Butter of Richfield, N. J., in Bogota, N. J., August 25.

ROBERT CALVIN BROWNLEE JR., Due West, S. C., to Miss Jewel Pharr in Charlotte, N. C., October 18.

SELMAR BURCHART to Miss Katherine Hawks, both of Memphis, Tenn., October 10.

IRVING CRAMER, Utica, N. Y., to Miss Helen Rubin of Albany, October 6.

Deaths

Charles Fletcher Davis ♂ Colonel, M. C., U. S. Army, retired, Parsons, Kan.; born in Arlington, Ore., May 20, 1888; University of Oklahoma School of Medicine, Oklahoma City, 1914; Army Medical School, Advanced Course, in 1932, and Medical Field Service School, Advanced Course, in 1936; fellow of the American College of Surgeons and the American Public Health Association; received the degree of master of public health at Johns Hopkins University School of Hygiene and Public Health in 1940; served overseas during World War I; entered the medical corps of the U. S. Army as a first lieutenant in 1920; rose through the various grades to that of colonel; trained more than twenty general and other hospitals for overseas duty in the various theaters during World War II and served overseas in North Africa as the commanding officer of the 21st General Hospital; retired Jan. 1, 1945 after having served twenty-five years in hospitals of the U. S. Army; superintendent of the Parsons State Hospital; died suddenly, July 26, aged 57, of coronary thrombosis.

James Wilkinson Jervey ♂ Greenville, S. C.; Medical College of the State of South Carolina, Charleston, 1897; born in Charleston, S. C., Oct. 19, 1874; honorary member and twice president of the South Carolina Medical Association; president of the South Carolina Ophthalmological and Otolaryngological Society, 1922-1923; past president of the Greenville County Medical Society; president of the American Laryngological, Rhinological and Otolological Society, 1933-1934, serving twice as chairman of its southern section; served as chairman of the section on ophthalmology and otolaryngology, for many years on the council and in 1937-1938 as president of the Southern Medical Association; member of the American Ophthalmological Society; specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology; medical director of Dr. Jervey's Private Hospital; formerly editor of the *Journal of the Medical Association of South Carolina*; died November 1, aged 71.

Robert Henry Ferguson ♂ Orange, N. J.; University of Vermont College of Medicine, Burlington, 1898; born in Boston, Nov. 4, 1857; member of the Massachusetts Medical Society and the American Association for the Advancement of Science; fellow of the American Society of Anesthetists, New York Society of Anesthetists, Interstate Association of Anesthetists, Pacific Coast Association of Anesthetists, Society of Anesthetists of Great Britain, Canadian Society of Anesthetists, Royal Society of Medicine, London, England, and the New York Academy of Medicine; associate member of the Southern Association of Anesthetists; served as chief of the medical department and the department of anesthetics, E. R. Squibb & Sons; devised an inhaler for etherization by the open drop method; died August 30, aged 87, of myocarditis.

James Philip Boylan ♂ New York; Columbia University College of Physicians and Surgeons, New York, 1927; born in Brooklyn, Sept. 1, 1895; assistant clinical professor of obstetrics and gynecology at the New York Medical College, Flower and Fifth Avenue hospitals; diplomate of the National Board of Medical Examiners; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; fellow of the American College of Surgeons; served during World War I; on the staffs of the New York City Hospital, House of Detention for Women, Vanderbilt Clinic and St. Clare's Hospital, where he died September 25, aged 50, of carcinoma of the larynx.

Mills Sturtevant ♂ New York; Columbia University College of Physicians and Surgeons, New York, 1908; born in Whitfield, N. H., April 7, 1882; professor of clinical medicine at the New York University College of Medicine; member of the American Gastro-Enterological Association and the International Gastro-Enterological Association; fellow of the American College of Physicians; specialist certified by the American Board of Internal Medicine; served on the staff of the Bellevue Hospital and the Rockaway Beach (N. Y.) Hospital; died in the Harkness Pavilion, Columbia-Presbyterian Medical Center, October 29, aged 63, of pneumonia.

Clifford Evan Howard, Ogdensburg, N. Y.; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1928; born in Gananoque, Ont., in 1905; member of the American Psychiatric Association; interned at the Royal Victoria Hospital in Montreal, Que.; formerly staff physician and surgeon at St. Lawrence Lumber Company in Trinity Bay, Que.; a member of the psychiatric staff of the Binghamton State Hospital in Binghamton from 1932 to 1942, when he became clinical director at the St. Lawrence State Hospital, a position he held at the time of his death on August 10, aged 40, of uremia.

Charles Lee Beeching ♂ Surgeon, Lieutenant Commander, U. S. Navy, retired, Kansas City, Mo.; University Medical College of Kansas City, 1908; entered the U. S. Navy on Oct. 3, 1911; retired June 30, 1937; recalled to active duty 1940, later retired because of illness; died August 29, aged 63, of coronary occlusion and hypertrophic arthritis.

William C. Boteler, Minneapolis; University of Maryland School of Medicine, Baltimore, 1878; died September 17, aged 90, of bronchopneumonia, arteriosclerosis and encephalopathy.

Robert Lester Botkin ♂ Duquesne, Pa.; University of Pittsburgh School of Medicine, 1919; director of the city bank; died September 24, aged 50, of coronary occlusion.

Oliver J. Caza ♂ Skowhegan, Maine; M.B. in 1905 and M.D. in 1907, School of Medicine and Surgery of Montreal, Faculty of Medicine of the University of Laval at Montreal; past president of the Somerset County Medical Society; served as town and school physician; on the staff of the Redington Memorial Hospital; for twenty-five years house physician for the State Reformatory for Women; died in the New England Baptist Hospital, Boston, October 25, aged 64, following an operation for carcinoma.

John Grigsby Clem, Louisville, Ky.; Hospital College of Medicine, Louisville, 1903; member of the American Medical Association; served during World War I; died in St. Joseph Infirmary September 28, aged 65, of coronary occlusion.

Frederick Stephens Cole, Inlet, N. Y.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1890; health officer; formerly member of the state legislature; served during World War I; died in Buffalo September 12, aged 80, of carcinoma of the bladder.

John Joseph Connolly, Louisville, Ky.; University of Louisville Medical Department, 1906; served as coroner and deputy coroner; died in SS Mary and Elizabeth Hospital September 11, aged 73, of hypertension.

Charles Johnston Davis ♂ Deerfield, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; served in the medical corps of the U. S. Army during World War I; formerly health commissioner; on the staff of the Highland Park (Ill.) Hospital; president of the Deerfield State Bank; died September 15, aged 70, of hypertension and hemiplegia.

Raymond del Mas, Hugo, Minn.; Dunham Medical College, Chicago, 1901; Hering Medical College, Chicago, 1903; died in San Francisco September 16, aged 74.

Charles W. Denny, North Madison, Ind.; University of Louisville (Ky.) Medical Department, 1893; member of the American Medical Association; honorary member of the Indiana State Medical Association; on the staff of the King's Daughters' Hospital in Madison, where he died September 26, aged 77, of coronary thrombosis and diabetes mellitus.

James Louis Early ♂ Radford, Va.; University College of Medicine, Richmond, 1901; past president of the Southwestern Virginia Medical Association; member of the American Medical Association; died September 1, aged 68.

John Thomas Eckert, Allentown, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1903; member of the American Medical Association; on the staff of the Sacred Heart Hospital, where he died September 13, aged 68, of generalized carcinomatosis.

Robert M. Elliott, Canandaigua, N. Y.; University of Buffalo School of Medicine, 1890; member of the American Medical Association and the American Psychiatric Association; formerly associate clinical professor of mental diseases at the Long Island College Hospital; for many years superintendent of the Willard (N. Y.) State Hospital; formerly junior assistant physician at the Rochester State Hospital; at one time affiliated with the Brooklyn State Hospital; died October 5, aged 82, of coronary thrombosis.

Toivo Johannes Forsstrom, Astoria, Ore.; Helsingfors Universitet Medicinska Fakulteten, Helsingfors, Finland, 1897; died August 16, aged 78.

Frank Durkee German ♂ Pontiac, Mich.; Detroit College of Medicine, 1906; served during World War I; examining physician for the draft board during World War II; on the staff of the Pontiac General Hospital; died September 26, aged 65, of carcinoma of the rectum.

Joseph Shem Gian-Franceschi ♂ Buffalo; University of Buffalo School of Medicine, 1908; specialist certified by the American Board of Radiology, Inc.; member of the Radiological Society of North America, Inc., and the American College of Radiology; secretary and past president of the Buffalo Radiological Society; member of the staffs of the Emergency and Columbus hospitals; an associate staff member of the Lafayette General Hospital; died October 17, aged 61, of cerebral hemorrhage and chronic nephritis.

Carlyle Newton Haines ♂ Athens, Pa.; College of Physicians and Surgeons, Baltimore, 1908; specialist certified by the American Board of Urology, Inc.; past president of the Bradford County Medical Society; member of the American Urological Association; fellow of the American College of Surgeons; served during World War I; formerly associated with the Guthrie Clinic and for many years on the staff of the Robert Paeker Hospital in Sayre; died September 22, aged 59, of coronary occlusion.

William Joseph Harkins, Quincy, Mass.; University of Vermont College of Medicine, Burlington, 1911; member of the American Medical Association and the New England Otological and Laryngological Society; served overseas during World War I; for many years on the staffs of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary in Boston; served as consultant at the Quincy City, Weymouth (Mass.), Milton (Mass.) and other hospitals; died August 25, aged 59.

Grace Frith Hagans Jerger, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1904; died September 18, aged 66.

Audley Clark Joslyn, Portland, Ore.; University of Oregon Medical School, Portland, 1928; captain, medical reserve corps, U. S. Army, not on active duty; died August 29, aged 49, of pulmonary hypertension with heart disease.

Henry Randal Kenny, Chicago; University of Dublin School of Physic, Trinity College, Dublin, 1909; member of the American Medical Association; on the staffs of the Illinois Masonic Hospital, Columbus Hospital and the Alexian Brothers' Hospital, where he died September 9, aged 59.

Frederick C. Liddle ♂ Dorset, Vt.; University of Vermont College of Medicine, Burlington, 1887; honorary member of the Vermont Medical Society; past president and vice president of the Bennington County Medical Society; honorary president of the Dorset Memorial Library; died September 17, aged 84, of pneumonia following a fractured rib received in a fall.

Edward Frank Marsh ♂ White Plains, N. Y.; Albany (N. Y.) Medical College, 1882; died September 4, aged 86, of carcinoma of the stomach.

Walter Bruce Maxwell, Nesbitt, Miss.; Louisville (Ky.) Medical College, 1874; for many years postmaster; died September 20, aged 93.

Bernard Vincent McCabe, Helena, Mont.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; served as president of the Lewis and Clark County Medical Society; died in St. John's Hospital in August, aged 73.

James M. McGeorge, Salem, Ohio; University of Wooster, Wooster, Ohio, 1902; member of the American College of Surgeons; served during World War I; on the staff of the Salem City Hospital, where he died September 1, aged 70, of generalized arteriosclerosis.

John Dickinson Milburn, East Hampton, Conn.; the Hahnemann Medical College and Hospital, Chicago, 1910; served as health officer and medical examiner; on the staff of the Middlesex Hospital, Middletown; died September 17, aged 64, of coronary thrombosis.

Willis Moore, Vermont, Ill.; Chicago Medical College, 1890; died August 16, aged 82.

I. J. Morris, Dallas, Texas; Vanderbilt University School of Medicine, Nashville, Tenn., 1905; died in Chicago August 18, aged 63.

Robert Shibley Moth, Council Bluffs, Iowa; the Hahnemann Medical College and Hospital, Chicago, 1905; served overseas during World War I; on the staff of the Jennie Edmundson Hospital, where he died August 27, aged 63, of carcinoma of the colon.

James Kay Newman, Omaha; Universidad Nacional Facultad de Medicina, Mexico, D. F., 1879; member of the American Medical Association; honorary member of the Nebraska State Medical Association; died in St. Joseph Hospital October 5, aged 96, of bronchogenic carcinoma.

Lewis Beauregard Newsom, West Monroe, La.; Memphis (Tenn.) Hospital Medical College, 1891; member of the American Medical Association; served on the staff of St. Francis Sanitarium, Monroe; died in Shreveport recently, aged 83, of senility.

Francis LeJau Parker ♂ Charleston, S. C.; Medical College of the State of South Carolina, Charleston, 1909; professor of chemistry at his alma mater, where he had served for a period as dean; died in Hendersonville, N. C., August 20, aged 69, of coronary disease.

Herman Frederick Schrader, Browning, Mont.; Jefferson Medical College of Philadelphia, 1910; member of the American Medical Association; served as vice president of the North Central District Medical Association; city health officer; affiliated with the Indian Service and physician in charge of the Blackfeet Hospital; died in the Deaconess Hospital, Great Falls, August 23, aged 65, of heart disease and cerebral hemorrhage.

John King B. E. Seegar Sr., Baltimore; Baltimore Medical College, 1900; member of the American Medical Association; fellow of the American College of Surgeons; gynecologist, St. Agnes' and Bon Secours hospitals; associate in gynecology at the Maryland General Hospital; died in the Johns Hopkins Hospital August 24, aged 76, of carcinoma of the stomach.

Gustav Maxim Steinbach ♂ Brooklyn; University of Aberdeen Faculty of Medicine, Scotland, 1933; interned at the Montefiore Hospital for Chronic Diseases in New York; served a residency and as a member of the staff of the Jewish Hospital; died August 30, aged 42, of coronary disease.

Claude Earl Stump, Kansas City, Mo.; University of Kansas School of Medicine, Lawrence and Kansas City, 1906; served as police surgeon and on the staff of the Ralph Sanitarium; died August 26, aged 63.

John Francis Swarens, Kansas City, Mo.; National Normal University College of Medicine, Lebanon, Ohio, 1892; Kentucky University Medical Department, Louisville, 1899; Southwestern Homeopathic Medical College and Hospital, Louisville, Ky., 1900; died August 23, aged 78, of coronary occlusion.

Alfred Charles Taylor, Mona, W. Va.; Chicago College of Medicine and Surgery, 1916; member of the American Medical Association; died in a hospital at Morgantown October 25, aged 67, of cerebral hemorrhage.

Frederick William Taylor, Baltimore; University of Maryland School of Medicine, Baltimore, 1884; formerly society editor of the *Sunday Sun*; died in the Johns Hopkins Hospital August 16, aged 83.

Frank C. Tinsley, Indianapolis; Central College of Physicians and Surgeons, Indianapolis, 1891; on the staff of the Methodist Hospital; died August 23, aged 81, of septic cystitis.

Newton Murray Tucker, Nashville, Tenn.; University of Tennessee Medical Department, Nashville, 1898; veteran of the Spanish-American War; died August 15, aged 74, of heart disease.

Smith Lanier Turner, Williston, Fla.; Atlanta College of Physicians and Surgeons, 1911; health officer of Levy County; died in Ocala, August 2, aged 59, of acute dilatation of the heart following an operation for gangrenous gallbladder.

George G. Van Mater, Peru, Ind.; New York Homeopathic Medical College and Hospital, New York, 1892; served during World War I; died in the Dukes-Miami County Memorial Hospital August 28, aged 82, of carcinoma.

Oscar Clinton Wainscott, Peru, Ind.; University of Louisville (Ky.) Medical Department, 1893; Bellevue Hospital Medical College, New York, 1896; served as medical examiner for the Miami County Draft Board during World War I; formerly president and chairman of the board of directors of the Wabash Valley Trust Company; died September 3, aged 75, of carcinoma of the prostate.

Edwin Bernard Weldon ♂ Bridgeport, Conn.; College of Physicians and Surgeons, Baltimore, 1913; specialist certified by the American Board of Pediatrics, Inc.; member of the American Academy of Pediatrics; attending pediatrician at Englewood Hospital and St. Vincent's Hospital, where he died August 11, aged 54, of coronary thrombosis.

Paul Whelan ♂ Seattle; University of Pennsylvania School of Medicine, Philadelphia, 1915; on the staffs of the King County and Doctors hospitals; died August 28, aged 58, of carcinoma of the stomach.

William Shipman Wiggins ♂ Exeter, Neb.; Michigan College of Medicine and Surgery, Detroit, 1895; past president of the Fillmore County Medical Society; for many years president of the board of education in Exeter and surgeon for the Burlington and the Chicago and Northwestern railroads; on the staff of the Lutheran Hospital in York; died August 19, aged 75.

Alexander E. Wilcox, Adrian, Mich.; Saginaw Valley Medical College, Saginaw, 1900; died August 3, aged 75.

William Lewis Yeomans, Bucyrus, Ohio; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1897; member of the American Medical Association; on the staff of the Bucyrus City Hospital; died August 30, aged 71, of arteriosclerosis.

Jerome Edward Young, Troy, N. Y.; Albany Medical College, 1896; died in the Troy Hospital August 10, aged 71, of pulmonary edema and chronic myocarditis.

DIED WHILE IN MILITARY SERVICE

Lawrence Benjamin ☉ Chicago; Loyola University School of Medicine, Chicago, 1929; interned at St. Francis Hospital; commissioned a captain in the medical corps, Army of the United States, on Nov. 17, 1943; died Nov. 27, 1944, aged 44.

Richard Booth Jr., Lynchburg, Va.; University of Virginia Department of Medicine, Charlottesville, 1943; interned at the Virginia Mason Hospital in Seattle; began active duty as a first lieutenant in the medical corps, Army of the United States, on Jan. 2, 1944; died in Germany May 12, aged 28, of injuries received in an airplane crash.

Arthur Smith Dutton, Indiana, Pa.; Western Reserve University School of Medicine, Cleveland, 1938; member of the American Medical Association and the Ohio State Medical Association; interned and served as assistant resident in surgery at Cleveland City Hospital; began active duty as a first lieutenant in the medical corps, Army of the United States, in March 1941; served as executive officer of the Station Hospital, Fort Knox, Ky.; promoted to captain and major; in August 1943 went to North Africa with the 118th Field Hospital; promoted to lieutenant colonel; later transferred to the 24th General Hospital and stationed in Italy; died in the 64th General Hospital, in northern Italy, July 17, aged 37, of exfoliative dermatitis and acute nephritis.

Irving Fagin, New York; St. Louis University School of Medicine, 1939; diplomate of the National Board of Medical Examiners; interned at the Beth David Hospital; began active duty on June 26, 1941, as a first lieutenant in the medical corps, Army of the United States; promoted to captain; died in the Southwest Pacific area Sept. 18, 1944, aged 28.

William Duncan Frostic, Wyandotte, Mich.; University of Michigan Medical School, Ann Arbor, 1937; member of the American Medical Association; formerly an intern and resident in surgery at the Harper Hospital in Detroit; served a residency in medicine at the Pontiac General Hospital in Pontiac; began active duty as a first lieutenant in the medical corps, Army of the United States, on Oct. 24, 1941; promoted to captain on June 21, 1943; flight surgeon with the American Air Forces; overseas since March 1945; killed July 30, aged 34, when his plane crashed while on a routine flight from a U. S. Army Base at Oahu, Hawaii.

William Hildreth Gillespie, New York; Columbia University College of Physicians and Surgeons, New York, 1938; diplomate of the National Board of Medical Examiners; served an internship, assistant residency and fellowship at the Presbyterian Hospital; began active duty as a captain in the medical corps, Army of the United States, on Feb. 15, 1942; promoted to major in September 1944; served in the United States and overseas in the Belgian Congo, Casablanca, Oran and France, with the Presbyterian Hospital Unit, the 23d Station Hospital, the 237th General Hospital and the 23d General Hospital; died in France June 7, aged 32, of acute infectious hepatitis with jaundice.

Thomas Herbert Greenway ☉ Three Rivers, Mass.; Tufts College Medical School, Boston, 1927; interned at the Eastern Maine General Hospital in Bangor, Maine; served as a member of the board of health and as associate medical examiner; member of the staff of the Wing Memorial Hospital in Palmer; major, medical corps, Army of the United States; shortly after entering the service was sent to the South Pacific as medical officer with an amphibious engineers' unit; at Lac was named for conspicuous heroism; died in the Cushing General Hospital, Framingham, June 23, aged 44, of carcinoma of the rectum with metastasis to the liver.

Leonard Watson Hassett ☉ Colonel, M. C., U. S. Army, Washington, D. C.; Tufts College Medical School, Boston, 1910; Army Medical School in 1922; became a lieutenant in the National Guard in 1912 and served as a captain during World War I; entered the medical corps of the U. S. Army as a captain on July 1, 1920; rose through the various grades to that of colonel; commanding officer of the Station Hospital, Camp Pickett, Blackstone, Va.; fellow of the American College of Surgeons; at one time served on the faculty of the University of Vermont College of Medicine in Burlington; died in the Woodrow Wilson General Hospital, Staunton, Va., July 25, aged 58, of coronary thrombosis.

Charles George Hutter ☉ Colonel, M. C., U. S. Army, Santa Barbara, Calif.; Northwestern University Medical School, Chicago, 1913; fellow of the American College of Surgeons; Army Medical School in 1916 and the advanced course at the Medical Field Service School in 1934; entered the medical reserve corps of the U. S. Army as a first lieutenant in March 1916; vacated in June 1916 and entered the medical corps of the regular army in the same rank; served with the third division overseas during World War I; promoted through the various ranks to that of colonel; formerly liaison officer, Office of the Surgeon General, U. S. Army, to the American Medical Association; died in the Hoff General Hospital June 26, aged 59, of hypopharyngeal hemorrhage due to carcinoma of the hypopharynx.

Edgar Shugert Ingraham, Mercer, Pa.; Western Reserve University School of Medicine, Cleveland, 1935; member of the American Medical Association and the American Association of Pathologists and Bacteriologists; specialist certified by the American Board of Pathology, Inc.; interned at the Presbyterian Hospital in Philadelphia; interned and served a residency at the University Hospitals in Cleveland; commissioned a first lieutenant in the medical corps, Army of the United States, on Sept. 10, 1941; promoted to captain on Nov. 9, 1942 and major on July 26, 1944; chief of laboratory services in the 142d Base Hospital at Calcutta, India; killed in India August 6, aged 34, in an airplane crash.

Levy Stephen Johnson ☉ Colonel, M. C., U. S. Army, Washington, D. C.; University of Texas School of Medicine, Galveston, 1912; Army Medical School in 1918 and postgraduate course in 1935; School for Flight Surgeons in 1920; began active duty as a first lieutenant in the medical corps of the U. S. Army on June 28, 1917; rose through the various grades to that of lieutenant colonel on July 28, 1937; promoted to the temporary rank of colonel on Oct. 31, 1942; died in Camp Barkeley, Texas, Jan. 8, 1943, aged 56, of heart disease.

Richard Paul Morden, Jefferson, Iowa; State University of Iowa College of Medicine, Iowa City, 1934; member of the American Medical Association; interned at the Mercy Hospital in Des Moines; commissioned a first lieutenant in the medical corps, Army of the United States, on July 30, 1942; promoted to captain; arrived in England in June 1943; died near Cambridgeshire, England, May 18, aged 39, of subarachnoid hemorrhage.

Robert John Rosenheimer, Kewaskum, Wis.; Marquette University School of Medicine, Milwaukee, 1943; interned at the Milwaukee County Hospital, where he served a residency in pathology; commissioned a first lieutenant in the medical corps, Army of the United States, in 1944; died in a hospital at Washington, D. C., July 16, aged 28, of tumor, argentaffine type, malignant, primary in the cecum, with metastasis to the bladder and ureters.

Henry Sutherland-Campbell, Los Angeles; McGill University Faculty of Medicine, Montreal, Que., Canada, 1920; associate clinical professor of medicine (dermatology) at the University of Southern California School of Medicine; member of the American Medical Association; specialist certified by the American Board of Dermatology and Syphilology; on the staffs of the Good Samaritan and St. Vincent's hospitals; commissioned a major in the medical corps, Army of the United States, on Sept. 8, 1942; died July 7, aged 55.

Robert Emery Trekeil, Wellington, Kan.; University of Kansas School of Medicine, Lawrence and Kansas City, 1944; an acting assistant surgeon lieutenant (jg) in the U. S. Navy while he served an internship at the Naval Hospital in Farragut, Idaho; lieutenant (jg) in the medical corps, U. S. Naval Reserve; died in the Pacific area April 22, aged 25, of accidental acute therapeutic poisoning.

Thomas Loftin Weber ☉ Olney, Ill.; Washington University School of Medicine, St. Louis, 1937; interned at the University Hospital in Baltimore and served a residency in pediatrics at St. Louis Children's Hospital in St. Louis; began active duty as a first lieutenant in the medical corps, Army of the United States, on Nov. 12, 1942; promoted to captain on Feb. 5, 1944; accidentally killed September 4, aged 34, while making a routine parachute jump at the Army Air Base at Watertown, S. D.

Correspondence

INJECTIONS OF DISTILLED WATER

To the Editor:—I should like to comment on your answer to an inquiry regarding the usefulness of injections of distilled water (*THE JOURNAL*, Oct. 20, 1945, p. 584).

You state that "there appears to be no basis for preference for water over isotonic solution of sodium chloride." I can think of at least three conditions in which this statement would not apply and, indeed, might even lead to danger. First, water is preferable in any condition in which there is deprivation of water alone, e. g., for a patient who is unable to replace water lost as insensible perspiration and from the lungs. This leads to dehydration, which involves some loss of electrolyte, but in general is associated with a retention of salt, or hypertonicity of the body fluids. True replacement therapy in such a case would consist in the injection of water with only a small amount of electrolyte. For such purposes a hypotonic solution of sodium chloride, preferably in 5 or 10 per cent glucose solution, should be employed. While it is true that an isotonic saline solution might correct dehydration in such a patient, it would be necessary to provide for the excretion of the excess salt; otherwise the excess might easily provoke deleterious results. For example, if the patient needed 3 liters of water and, say, 5 Gm. of sodium chloride, the use of isotonic saline solution would introduce 27 Gm. of sodium chloride, of which 22 is excessive and which would provoke difficulty if the kidneys were unable to excrete it. Such a situation occurs not infrequently after severe operations, when renal function may be temporarily impaired and adrenal function accelerated. These patients lose water through the lungs and through other insensible channels, which requires replacement, but unless there has been vomiting or similar occurrence water alone is needed. In such cases the injection of much isotonic solution of sodium chloride has actually been shown to be deleterious.

A third condition in which isotonic solution of sodium chloride may provoke difficulty as compared with water without electrolyte is water deprivation in severe malnutrition with hypoproteinemia. In such a case the injection of isotonic solution of sodium chloride has been shown frequently to lead to so-called salt edema. While distilled water alone is rarely injected, 5 or 10 per cent glucose solutions without electrolyte is the usual method employed for the introduction of pure water. In this way an isotonic or slightly hypertonic solution enters the blood stream, after which the glucose is rapidly burned, leaving water itself.

These considerations, among others, emphasize the importance of distinguishing carefully between the need for water and the need for sodium chloride. The need for each or both must depend on the circumstances in the individual case. More important is the well established fact that excessive sodium chloride, unlike excessive water, is much more likely to prove deleterious and thus defeat the objectives of such parenteral injections.

ROBERT ELMAN, M.D., St. Louis.

CURARE THERAPY

To the Editor:—May I point out that the paper of Dr. Harold R. Griffith "Curare and Anesthesia," which was published in *THE JOURNAL*, March 17, is incomplete in its history of the use of the drug. He states that "clinicians had more than once cast hopeful eyes toward the possible use of curare in the treatment of spastic disease of the muscles but always its poisonous reputation and the presence of cardiac depressants and other adulterants in the available supplies made clinical trial seem too dangerous." This statement may have been true with specimens of curare antedating the use of the curare which was

biologically assayed for me by Merck & Co. and used in many cases of spastic paralysis and allied conditions such as dystonia.

The first paper, "Curare Therapy for the Release of Muscle Spasm and Rigidity in Spastic Paralysis and Dystonia Musculorum Deformans," was published in the *Journal of Bone and Joint Surgery* in July 1938. A second study, "Therapeutic Use of Curare and Erythroidine Hydrochloride for Spastic and Dystonic States," was printed in the *Archives of Neurology* in February 1939. A third, "Clinical Experiences with Some Curare Preparations and Curare Substitutes," appeared in the *Journal of Pharmacology and Experimental Therapeutics* in June 1940, and, lastly, a summary of "Observations in Spastic Paralysis and Dystonia Musculorum Deformans" was read before the Boston Society of Psychiatry and Neurology on Oct. 20, 1938 and published in the *Journal of Nervous and Mental Disease* in June 1939.

These studies represent the first extensive use of curare with an assayed preparation.

I note also that the Council on Pharmacy and Chemistry has accepted the Squibb preparation of curare (*THE JOURNAL*, October 13). This preparation is an excellent one. I think it an error, however, to accept the trade name of the product. A similar policy, I believe, should be applied to all drugs to avoid confusing nomenclature.

MICHAEL BURMAN, M.D., New York.

USE OF GROUP O BLOOD IN TRANSFUSION

To the Editor:—In reply to a recent query concerning the use of A and B group substances to render group O blood safe for use for recipients of all blood groups, the statement was made that there is still no direct evidence establishing the efficacy of the group substances *in vivo*, when used in this way (*THE JOURNAL*, Nov. 17, 1945, p. 840). Our purpose in this communication is to describe briefly some recent experiments which supply this direct evidence.

Group B plasma having a very high titer of anti-A agglutinins was obtained from a blood donor who had been immunized by an injection of soluble group substances. The titer of the anti-A agglutinin for A₂ cells by the well slide method reached as high as 2,500 units (equivalent to 10,000 units by the tube technic or about two hundred times the average normal titer) but had fallen to a titer of 500 units by the slide technic by the time the plasma was collected from the donor some three months after the injection. A thousand cubic centimeters of this plasma was obtained at one time by withdrawing 1,800 cc. of blood from the donor and simultaneously replacing it with an equal volume of group B bank blood. As little as 25 cc. of the untreated plasma caused a frank hemolytic reaction in a voluntary group A₁ recipient, manifested by hemoglobinuria, pain in the back and increased bilirubinemia. Fifty cc. caused an even more pronounced reaction. In a volunteer of group A₂, 25 cc. of the plasma caused no obvious reaction but 50 cc. gave rise to signs of hemolysis. All these recipients were secretors.

To test the efficacy of Witbsky's A and B group substances to counteract the harmful effect of the plasma in question, Eli Lilly's preparation was added to the plasma in the proportion of 10 cc. for every 250 cc. of plasma. One group A₁ and one group A₂ volunteer was then each given 250 cc. doses of the neutralized plasma, and neither one exhibited any obvious manifestation of hemolysis. Similar results were obtained in a larger series of cases using other plasma. These results will be published shortly in detail, when the experiments have been completed.

DETERMINATION OF RH FACTOR

To the Editor:—For almost a year I have been doing Rh factor tests on obstetric patients. The last six months I have been doing them routinely. The Nebraska State Health Department began offering this service about a month ago without charge. In my opinion it is a very definite advance in obstetrics.

Another great step forward will have been taken when all newborn babies, especially girls, have an Rh factor determination done at once as a part of the American newborn routine care. If the infant's test is Rh negative it should be rechecked in about three months because blood characteristics are not well developed in the first few days of life. I believe that a concerted effort ought to be put forth by the American Medical Association and other legitimate channels of propaganda, with the hope that the Rh factor determination will become a standard routine.

Those acquainted with the Rh factor realize that if this procedure is carried out and the Rh factor of each individual is obtained, the error of giving the wrong blood in infancy and from then on may be avoided. This once accomplished, there will be much less danger of the first baby having erythroblastosis. Also in case of emergency there will be a much better chance of obtaining the proper blood promptly.

MEDICOLEGAL ABSTRACTS

Malpractice: Simultaneous Application of Tight Bandaging and Heat to Arthritic Foot.—Mrs. Treptau was suffering from what she thought was a sprain of her right foot and on Aug. 27, 1941 she went for treatment to the Behrens Spa, Inc., a hospital incorporated under the laws of Wisconsin and having as full time employees several chiropractors and at least one doctor of medicine. She was examined by Dixon, a chiropractor employed by the Spa, who advised her that she needed "vertebra adjustments," several of which were given to her by Dixon and by Behrens, another chiropractor, until September 14. In the course of those so-called treatments the swelling and pain in the foot increased greatly. September 14, a roentgenogram was taken under Behrens' direction at the Spa, and "by palpation in combination with the x-ray he determined that she was suffering from arthritis." He then applied a circular bandage consisting of two pieces of tape about 18 inches long and 1½ inches wide, starting one piece of tape about the top of the instep and going around the instep twice, and the other piece of tape went the other way. While applying the tape he told his patient that she had a bone infection and to grind her teeth as he tied the bandaging "real tight." This caused the patient a great deal of pain. Behrens then ordered "diathermo heat treatments" applied immediately. Two such treatments were given on each of the two following days. After the first heat treatment the patient was put in bed at the Spa. On her repeated complaints that the bandaging was too tight and that the pain was too great, a physician employee at the Spa apparently loosened the tape somewhat at the top of the foot but not around it. When the subsequent heat treatments were given the circular bandage was still in place and unloosened around the foot. The patient complained continually of great pain and the foot began to swell. On the 16th, the foot became black and blue, was very painful, and was so swollen that it covered the upper part of the adhesive tape bandage. On the failure of nurses attending her to bring a "doctor" to alleviate her pain, she induced the nurses to take the tape off her foot. The next day she returned to her home and called Dr. Wheelihan,

a physician, in on the case. Dr. Wheelihan testified that when he first examined the patient he found the foot extremely swollen and very tender to touch, that this condition indicated a markedly impaired circulation, one of threatened gangrene which was the result of the impaired circulation. Just what the subsequent history of the case was the reported decision does not make clear except that at the time of the trial there was a loss of flexion and limitation in the foot, apparently a permanent condition.

The patient and her husband subsequently sued the defendant corporation, which operated the so-called Spa, for damages sustained by the patient as the result of alleged malpractice in the treatment rendered by the chiropractors employed by the Spa. On behalf of the plaintiffs three practicing physicians were called as witnesses, Dr. Wheelihan, who attended her after she left the Spa, and Drs. Werra and Nicely. Dr. Wheelihan testified that the probable and direct cause of the impaired circulation and the condition that he found when he first examined the patient was the constricting tape applied by chiropractor Behrens and the diathermic treatments ordered by Behrens while the tape was in place; that the treatment given was not in accord with the recognized proper practice of the community; that the combination of constricting bandage plus diathermy was not proper in any school or field of medicine; that a bandage constricts the circulation and heat tends to increase the circulation; that one or the other would have been proper, but not the combination; and that in his opinion such treatment and accentuation of the arthritic condition of the foot probably resulted in the present condition of the foot. The testimony of Drs. Werra and Nicely was to the same effect. The jury, in a special verdict, found that by the simultaneous bandaging and application of diathermic treatments the defendant failed to exercise the skill and care required by law and that failure was the cause of the disability suffered by the patient after treatment. The court accordingly entered judgment for the plaintiffs, and the defendant appealed to the Supreme Court of Wisconsin.

The defendant contended first that the trial court disregarded the well established principle of law that a physician is not liable for malpractice if he selects and uses one approved method of treatment although there may be testimony that if other expert witnesses had been treating the case they would have used another method or that the method employed was improper and that since there was testimony that the method employed by Behrens was a method of treatment recognized by the medical profession in that vicinity the defendant cannot be held guilty of malpractice. The trial court, however, said the court, consistently considered applicable the rule of law contended for by the defendant, as is exemplified in the following instruction it gave to the jury:

You are further instructed that if you find from all the credible evidence in the case that the school of medicine recognizes more than one method of diagnosis or treatment of the condition which affected the plaintiff's right foot, it [defendant] was not required, at its peril, to select one or the other of such methods and was at liberty to select either of said methods and may not be considered wanting in the required degree of care and skill merely because expert witnesses give their opinion that some other method would have been preferable.

Consequently, the defendant's contention in this respect cannot be sustained.

The defendant next contended that a verdict in a malpractice case must be based on expert testimony that there was malpractice present and that the malpractice proximately caused the condition complained of. That rule of law, answered the court, is correct but again it is evident from the record that the trial court rightly concluded and duly instructed the jury that the plaintiffs must prove to a reasonable certainty by expert testimony that there was malpractice present and that such malpractice proximately caused such damages as the jury assessed. The jury was free to accept in determining those issues either the expert testimony offered by the physicians who testified for the plaintiff or the testimony of the chiropractors in the defendant's employ.

The defendant contended further that there was no credible evidence adduced at the trial to sustain to a reasonable certainty the jury's finding that the use of the treatments in combination by Behrens was the cause of the increased ailments, disabilities and suffering, or that such increase, if any, was a natural and

probable result of such use of treatments by Behrens. The defendant claimed that there was testimony that the patient's ailments, disabilities and pain could have been caused by the arthritic condition which affected her foot and that the burden of proof resting on the plaintiff is not met by showing that the ultimate condition might also have been caused by Behrens' unskilful treatment; that there was no testimony that the bandages were applied in such a manner as to impair circulation of the foot; that the claim that a tight bandage would aggravate an arthritic condition has no basis on medical fact; and that in the absence of gangrene no injury could result from the application of a tight bandage. This argument of the defendant, said the court, cannot be sustained. The jury's findings as to the defendant's malpractice and that it caused increased ailments, disabilities and suffering and damages is warranted by the testimony of the three physicians called by the plaintiffs.

The defendant next contended that medical practitioners such as were the three physicians called by the plaintiffs are not competent to testify as to the degree of care and skill required to be used by a chiropractor in treating a patient, relying on *Nelson v. Dahl*, 174 Minn. 574, 219 N. W. 941, reading in part as follows:

When a patient selects one of the several recognized schools of treatment, he thereby adopts and accepts the kind of treatment common to that school; and the care, skill, and diligence with which he is treated, when that becomes a question in the courts of this state, must be tested by the evidence of those who are trained and skilled in that particular school of treatment.

The rule contended for, said the Supreme Court, is not applicable in view of the real issue in this case. Plaintiffs do not claim that there was malpractice on the part of the defendant while Behrens was engaged in the practice of chiropractic by chiropractic manipulations or adjustments of the spine. Instead, plaintiffs contend there was malpractice when he and his associates went beyond the practice of chiropractic and entered into the general field of the practice of medicine, by the application of the bandage to the foot and by giving in conjunction therewith the diathermo heat treatments, neither of which was the practice of chiropractic by chiropractic manipulation or adjustment of the spine. On the contrary, the application of the bandages and the heat treatments given in this case are part of the general practice of schools of medicine, and, in so far as there was thus an invasion of the general field of that practice, the methods thus used by defendant's employees in diagnosis and treatment were subject to the rules applicable in the practice of medicine and surgery. Consequently there was applicable in this case the rule that the considered opinion of a qualified member of the profession of medicine and surgery is competent and proper as to whether or not the treatment given constituted the required degree of care and skill which physicians in good standing in the community usually exercise. When there is such an invasion of the field of medicine by the treatment given, the rule, which confines the inquiry as to the required degree of a practitioner's skill and care to the rules and principles of chiropractic or the particular school of science or medicine to which he belongs, does not exclude the testimony of physicians of the other schools when that testimony bears on a point in relation to diagnosis or treatment as to which the principles of the schools do or should concur. When a chiropractor assumes to diagnose and to treat disease he must exercise the care and skill in so doing that is usually exercised by a recognized school of the medical profession. *Kuechler v. Volkmann*, 180 Wis. 238, 192 N. W. 1015.

The court also did not agree with a contention of the defendant that because it was a hospital and could not lawfully engage in the practice of medicine it could not be held liable for damages caused by malpractice in the performance of professional acts of its staff. In arriving at this conclusion the court quoted from 26 Am. Jur. p. 597, reading as follows:

A hospital conducted for private gain is liable to its patient for injuries sustained by him in consequence of the incompetency or negligence of a physician treating him at its instance, under a contract binding it to furnish him proper treatment. A physician so employed is not an independent contractor.

The judgment in favor of the patient and her husband was accordingly affirmed.—*Treptau v. Behrens Spa, Inc.*, 20 N. W. (2d) 108 (I's., 1945).

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examination of the National Board of Medical Examiners and the Examining Board in Specialties were published in THE JOURNAL, Dec. 22, page 1226.

BOARDS OF MEDICAL EXAMINERS

- ALABAMA:** Mar. 19-21. Sec. Dr. B. F. Austin, 519 Dexter Ave., Montgomery 4.
- ALASKA:** Juneau, March 5. Sec., Dr. W. M. Whitehead, Box 140, Juneau.
- ARIZONA:** * Phoenix, Jan. 4-5. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.
- CALIFORNIA:** * *Written*. Los Angeles, March 11-14. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento 14.
- CONNECTICUT:** * *Examination*. New Haven, March 12-13. *Endorsement*. New Haven, March 26. Sec. to the Board, Dr. Creighton Barker, 258 Church St., New Haven.
- DISTRICT OF COLUMBIA:** * *Reciprocity*. Washington, March 11. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6150 E. Municipal Bldg., Washington 1.
- IDaho:** Boise, Jan. 15. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.
- ILLINOIS:** Chicago, Jan. 8-10. Supt. of Registration, Department of Registration & Education, Mr. Philip Harman, Springfield.
- INDIANA:** Indianapolis, April 25-27. Sec., Board of Medical Registration & Examination, Dr. W. C. Moore, 301 State House, Indianapolis 4.
- KENTUCKY:** Louisville, March 25-27. Sec., State Board of Health, Dr. Philip E. Blackerby, 620 S. Third St., Louisville 2.
- MAINE:** Portland, March 12-13. Sec., Board of Registration of Medicine, Dr. A. P. Leighton, 192 State St., Portland.
- MICHIGAN:** * Detroit, March 26-28. Sec., Board of Registration in Medicine, Dr. J. E. McIntyre, 100 W. Allegan St., Lansing 8.
- MONTANA:** Helena, April 1-3. Sec., Dr. O. G. Klein, First National Bank Bldg., Helena.
- NEVADA:** Carson City, Feb. 4. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.
- NEW JERSEY:** Trenton, June 18-19. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.
- NEW MEXICO:** * Santa Fe, April 8-9. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.
- NEW YORK:** Jan. 28-31. Sec., Dr. Jacob L. Lochner, Education Bldg., Albany.
- NORTH CAROLINA:** *Reciprocity*. Raleigh, Jan. 16. Sec., Dr. Ivan Proctor, Raleigh.
- NORTH DAKOTA:** Grand Forks, Jan. 1. Sec., Dr. G. M. Williamson, 412 S. Third St., Grand Forks.
- OHIO:** *Endorsement*. Columbus, Jan. 8. *Examination*. Columbus, March 19-22. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.
- OKLAHOMA:** * Oklahoma City, March 23. Sec., Dr. J. D. Osborn Jr., Frederick.
- OREGON:** * Jan. 23-26. Exec. Sec., Miss L. M. Conlee, 608 Failing Bldg., Portland 4.
- PENNSYLVANIA:** Harrisburg, January. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.
- RHODE ISLAND:** * Providence, Jan. 3-4. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.
- SOUTH DAKOTA:** * Pierre, Jan. 15-16. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.
- TEXAS:** Austin, March 27-29. Sec., Dr. T. J. Crowe, 918-20 Texas Bank Bldg., Dallas 2.
- VERMONT:** Burlington, March or April 1946. Sec., Dr. F. J. Lawliss, Richford.
- WASHINGTON:** * Seattle, Jan. 14-16. Dir., Department of Licenses, Mr. Harry C. Huse, Olympia.
- WEST VIRGINIA:** Charleston, Jan. 7-9. Commissioner, Public Health Council, Dr. John E. Offner, State Capitol, Charleston 5.
- WISCONSIN:** * Madison, Jan. 8-10. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.
- WYOMING:** Cheyenne, Feb. 4. Sec., Dr. G. M. Anderson, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

- CONNECTICUT:** Feb. 9. Address State Board of Healing Arts, 250 Church St., New Haven 10.
- FLORIDA:** Gainesville, June 4. Final date for filing application is May 20. Sec. Dr. J. F. Conn, John B. Stetson University, DeLand.
- IOWA:** Des Moines, Jan. 8. Dir., Division of Licensure & Registration, Mr. H. W. Greff, Capitol Bldg., Des Moines.
- MICHIGAN:** Ann Arbor and Detroit, Jan. 11-12. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.
- MINNESOTA:** Minneapolis, Jan. 2-3. Sec., Dr. J. C. McKinley, 126 Millard Hall, University of Minnesota, Minneapolis 14.
- NEBRASKA:** Omaha, Jan. 8-9. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln 9.
- OKLAHOMA:** Oklahoma City, Jan. 21. Sec., Dr. J. D. Osborn Jr., Frederick.
- OREGON:** Portland, March 2. Sec., Board of Higher Education, Mr. C. D. Byrne, University of Oregon, Eugene.
- RHODE ISLAND:** Providence, Feb. 13. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.
- SOUTH DAKOTA:** December. Sec., Dr. J. D. Alway, Aberdeen.

Current Medical Literature

AMERICAN

The Association Library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Influence of Biologic Factors on Form of Roentgen Ray Survival Curves: Experiments on Paramesium Caudatum. A. Back and L. Halberstaedter.—p. 290.
Calculation of Radium Dosage Along Longitudinal Axis of Linear Sources. B. S. Wolfe.—p. 296.

Teratoma of Testis.—Barner reports 65 cases of teratoma of the testis treated within thirty-three months at an army general hospital. This was 2.62 per cent of all cases admitted to the genitourinary service and 7.86 per cent of all cases of cancer. The following factors have been suggested as contributory to the etiology of these malignant tumors: heredity, abnormal development, sexual activity, trauma, occupation, biochemical or endocrine changes and infections. Of these the most significant is probably abnormal development. The growth of this tumor is usually insidious and the patient may not be aware of it for some time. Painless swelling is the most frequent symptom. The testis usually retains its natural shape and outline. Early diagnosis is the most important factor in a high survival rate. Treatment should rely on surgery and postoperative irradiation. Orchiectomy and removal of the cord with the accompanying structures high at the internal abdominal ring are indicated in every case because it makes possible the removal of much of the lymphatic tract and contributes to the postoperative comfort of the patient. A remaining stub of the cord is not only a potential site for recurrence but is also tender and a source of irritation and discomfort. External high voltage roentgen therapy is begun as early as the third or fifth day after operation with 220 kilovolts, 15 milliamperes, 50 cm. target-skin distance, 0.5 to 1 mm. of copper plus 1 mm. of aluminum as filter and 47 to 32 roentgens per minute (measured in air). The number of fields irradiated depends on the presence or absence of metastases and the duration of symptoms before operation. Irradiation is given daily except Sundays.

The daily amounts of radiation are 200 to 250 roentgens to each of two fields, in rotation, until a total of 1,600 to 2,000 roentgens per field has been administered. Follow-up revealed that 7 of the 65 patients have died.

Roentgen Irradiation in Ankylosing Spondylarthritis.—Hemphill and Reeves present an analysis of 160 cases of Marie-Strümpell disease in which the pathologic picture is a true atrophic arthritis. The course is that of a progressive deforming arthritis unless correction and prevention of the deformities are instituted. During the earliest inflammatory stage of the disease roentgenograms may be negative. Forty-five degree angle roentgenograms may show changes about the articular facets of the vertebrae. The facets of the twelfth dorsal vertebra are frequently affected earlier than others. Usually the earliest detected changes are in the sacroiliac joints and consist of decalcification and irregular trabeculation in the subchondral bone immediately adjacent to the joint space, with haziness and apparent widening of the joint space. Of the 160 patients 137, or 86 per cent, were male. More than three fourths of the patients were between 20 and 39 years of age. Muscle spasm may exist for years before ossification of ligaments takes place. Roentgen therapy finds its greatest usefulness in allowing orthopedic treatment and correction of the deformities to be tolerated by the patient. During roentgen treatment, which employs 200 kilovolts at 30 to 50 cm. distance with a filter of 0.5 mm. of copper plus 1 mm. of aluminum, the spinal column is blocked off by lead shields in such a way that the lateral spinal ligaments are included in the beam. Two or three fields are treated every day or every other day with 150 roentgens in air to each field until a total of 450 or 600 roentgens has been applied per field. The series of high voltage roentgen treatments can be repeated at the end of six or eight weeks. The pathologic granulations of Marie-Strümpell disease are similar to the vascular granulations of other inflammatory reactions known to be radiosensitive. Whether or not roentgen therapy arrests this granulation before ankylosis develops cannot be answered. It is felt, however, that if roentgen therapy can be instituted while there is still active granulation (and not complete ankylosis) good results may be expected.

Responsibility of Physical Therapist to Community. D. W. Gudakunst.—p. 590.

Crutch Gaits.—Deaver and Brown think that all crutch walkers should learn at least two gaits: a fast one to be used in the open, or in crossing a street, and a slow one for crowded places where space is limited but balance must be kept as slow progression is made. A patient should be taught as many

crutch gaits as he can master. He should know more than one, because each crutch gait requires a different combination of muscles, and a disabled person who becomes fatigued with one may change to another. Each crutch gait can be used as an exercise. The most elementary standard crutch gait consists in advancing one crutch, then the opposite foot, then the other crutch and finally the other foot. This four point alternate gait is a safe gait because there are always three points of support on the floor. It is a slow gait because weight must be constantly shifted. It does not require much space, so that it is a good gait to use in crowds or where space is limited. Once the four point alternate gait has been mastered, the subject may be taught next the two point alternate, which involves placing one crutch and the opposite foot down on the floor simultaneously, then the other crutch and the other foot simultaneously. This is no more than a speeding up of the four point alternate gait. This is a faster gait than the four point. The three point crutch gait is the one in which the two crutches and the weaker limb are placed on the floor simultaneously, then the stronger limb, which, being strong enough to support the weight of the body, needs no crutches. This gait is used by those having one lower extremity which cannot take full weight bearing and one which can support the whole body weight. The author describes the tripod crutch gaits and the swinging crutch gaits, also the rocking chair crutch gait and the amputation crutch gaits. The four point alternate and the two point alternate crutch gaits are taught to amputation subjects. The subject with artificial limbs is supported by his artificial limbs. He does not need the crutches for support. He needs them for balance. The aim is to use crutches at first for balancing purposes until the subject has "the feel" of his artificial limbs.

Effect of Alcohol and Potassium Hydroxide Concentration on Reaction of 17-Ketosteroids with *m*-Dinitrobenzene. Hildegard Wilson and I. T. Nathanson.—p. 208.

Pancreatectomy and Alloxan Diabetic Dogs.—Thorogood and Zimmermann observed that, although glycosuria is more severe and the insulin requirement higher in alloxan treated than in pancreatectomized dogs, the former are able to live much longer without insulin treatment and fail to develop ketosis and diabetic coma. This has been confirmed by pancreatectomy in alloxan diabetic dogs following which the insulin requirement is less, but the animals pass quickly into coma when not controlled with insulin. One hypothesis suggests that there is secreted by the pancreas a second endocrine factor which acts to increase the blood sugar but to prevent ketosis in the insulin deficient animal. This hypothesis is a tentative one which seems to be the simplest explanation of the data, though it can be confirmed only by the actual preparation of an extract possessing these types of activity.

Spontaneous Rupture of Uterus During Late Pregnancy.—Milnor reports the case of a primigravida aged 27 whose pregnancy had progressed normally up to three weeks before the expected date of delivery on March 22, 1945. At 3 a. m. on March 2 she was awakened from a sound sleep by the urge to urinate. After voiding she went back to bed. One-half hour later a most severe abdominal pain started with nausea followed by several very profuse and loose stools. She had retired at 9:30 p. m. feeling fine and had led a normal life the day before. The distress grew worse. She felt "as though something had burst" within her. Breathing became difficult and great substernal distress was noticed. She felt faint. She did not arrive at the hospital until three hours after the onset of the pain. When she arrived, after a 10 mile taxi ride, she was in extreme shock. She continued to vomit but said that the pains were a little less severe. The abdomen was tender and distended. Its contour was very irregular, saddle-like, with a mass in the upper left quadrant and another in the suprapubic region. A diagnosis of ruptured uterus was made. One-half hour elapsed between the time of diagnosis and laparotomy, four hours after the first pain. A 7 pound (3,175 Gm.) stillborn child was found free in the upper left abdomen. The placenta was found to be plugging a 6 cm. rent in the right posterior wall of the uterus. Blood clots and amniotic fluid were present in large amounts in the abdominal cavity. The child was quickly delivered and the placenta extracted. The uterus was removed subtotally. The patient recovered rapidly. The cause of this sudden accident three weeks before term, and before the onset of labor, is unexplained. There was no disease of the uterus demonstrated. There may have been a sudden violent movement of the fetus, which in turn caused a violent contraction lacerating the uterus.

*Tuberculosis Among College Students: Fourteenth Annual Report of Tuberculosis Committee, American Student Health Association, for Academic Year 1943-1944.—p. 322.

Tuberculosis Among College Students.—The fourteenth annual report of the Tuberculosis Committee of the American Student Health Association covers the reported case finding programs in 286 colleges during 1943-1944. Of 282 colleges, 199 include a tuberculin testing routine and 83 employ chest roentgenograms without preliminary testing. Student enrolment at institutions having survey programs was 286,018. Among these 622 new cases of tuberculosis were diagnosed, a rate of 217.4 per hundred thousand. The lesions were classified as unstable in 156 and quiescent in 151; 315 were designated as healed. Students withdrawing from college to undergo treatment numbered 169. The committee emphasizes the need for active treatment in the majority of cases of tuberculosis found among young men and women of college age. Of the 622 students discovered to have early tuberculosis 453 were permitted to remain in college. It seems highly probable that a considerable proportion of this group may experience progression of their disease and will eventually have to undergo treatment. The two dose Mantoux method is recommended as the method of choice in tuberculin testing. If a single test dose is employed, an intermediate dose of at least 0.1 mg. old tuberculin or 0.0001 mg. of purified protein derivative should be used. The

Vollmer patch test cannot be recommended for use in colleges. It is sound practice and in the interests of economy to provide chest roentgenograms for only those students who react to an adequate dose of tuberculin. Complete protection against tuberculosis for college students cannot be attained through a program limited to the student body. Faculty members and employees, including food handlers, should participate in the tuberculosis control program. The lesions of pulmonary tuberculosis encountered in college students are, in a majority of instances, unstable and potentially dangerous. The absence of symptoms does not preclude the necessity for early treatment. Students with pulmonary lesions who remain in college should be under close observation, with frequent clinical and roentgenographic studies.

Hinton Reactions Following Chickenpox.—Kane and Henneman during the last eighteen months observed the occurrence of transient false positive Hinton reactions in patients convalescent from chickenpox. The cases of chickenpox include 11 occurring in Harvard University students and 11 in children. All bloods were carefully drawn and the tests were carried out by the same skilled technician using undiluted serum. Wassermann, Hinton and Kahn tests were performed on each specimen. Five of the 22 patients with chickenpox exhibited transient false positive Hinton reactions for syphilis. In addition, 1 patient developed a transient positive Kahn reaction. No false positive Wassermann reactions were obtained.

Streptomycin and Promin in Experimental Tuberculosis.—Smith and McClosky report that daily intramuscular injections of 5,000 units of streptomycin for a period of ninety days in guinea pigs infected with a human strain of tubercle bacilli has produced a chemotherapeutic effect superior to that obtained with 0.5 Gm. of promin per kilogram of weight given orally for the same length of time. Since the dose of promin used is about half the maximum tolerated dose while the dose of streptomycin is less than one-twentieth the toxic dose, it appears that streptomycin has a chemotherapeutic index better than ten times that of promin. It also seems possible that by increasing the dose of streptomycin and with better methods of administration its chemotherapeutic effectiveness may be enhanced. Using a suitable combination of streptomycin and promin, it was possible to obtain better results under the experimental conditions employed by the authors than have ever been obtained previously.

The Adrenal in the Waterhouse-Friderichsen Syndrome.—London and Holman report 5 cases of Waterhouse-Friderichsen syndrome. One patient had meningococcal meningitis and appeared moribund on admission but recovered following intensive sulfadiazine therapy. Four of the patients were diagnosed clinically as having Waterhouse-Friderichsen syndrome. Only 3 of these patients presented postmortem massive adrenal hemorrhage necessary to fulfil the criteria for the diagnosis of this syndrome. There was nothing in the clinical or laboratory data to distinguish the case that failed to meet the criteria from those which did. One case is unique in that the typical symptoms with positive blood cultures (meningococcus type II-A) and massive adrenal hemorrhage occurred in a woman aged 30 who was eight months pregnant. The fetal blood culture was positive for the same organism, but the fetal adrenals appeared normal. This case provides the human counterpart of the experiments of Stewart and Rogoff, who showed that bilateral adrenalectomy was without effect in pregnant dogs because ample cortical hormone was supplied by the fetal adrenals. The authors believe that the currently accepted view that death in cases of Waterhouse-Friderichsen syndrome is due to adrenal insufficiency secondary to hemorrhage in the adrenal glands is untenable and that the indications for adrenal cortex therapy are as great in all cases of severe septicemia and toxemia as they are in cases of Waterhouse-Friderichsen syndrome.

Surgical Treatment of Chronic Mental Illness.—Hofstatter and his associates review the clinical results obtained with bilateral prefrontal leukotomy in the first hundred institutionalized patients operated on since 1941. This series represents patients who have been ill for an average of ten years and have been hospitalized for an average of five years. Many of these showed not only social maladjustment but definite antisocial behavior on a noisy, combative and destructive level, often with suicidal or homicidal tendencies. They had received many other types of therapy, all of which had failed to influence the psychosis. In 65 of the patients all four quadrants were cut. In 35 patients leukotomy was limited to the lower (orbital) quadrants exclusively, with no statistical difference in therapeutic effect. Comparing the results in these 100 patients with those obtained in a survey of 582 patients in seventeen other centers, the authors find that the percentages lie close together; they report 33 per cent much improved, 34 per cent improved and 31 per cent slightly or not improved, which compares favorably with 31, 33 and 30 per cent. They think that the results justify the use of this procedure in the chronic mentally ill.

Meningitis After Spinal Analgesia.—Kremer reports 7 cases of infection of the subarachnoid space after spinal analgesia. In 1 the necropsy showed a chronic inflammation of the subarachnoid space, which had resulted in fibrin deposition with subsequent organization. In this process of organization pools of infected cerebrospinal fluid had become isolated. If the fibrin should break down, this infected cerebrospinal fluid would be liberated into the general subarachnoid circulation. These isolated areas may not develop the same concentration of therapeutic substances as is present in the free flowing cerebrospinal fluid. If the causative organism is sensitive to sulfonamides it is cleared only from the general cerebrospinal fluid circulation and not from these loculi. These areas of isolated cerebrospinal fluid occasionally are freed and cause the relapses which form the most striking clinical feature of the infection. There can be little doubt that the spinal analgesics are mild irritants; it is possible that this irritation results in the outpouring of protein rich fluid, which provides a favorable medium for pathogenic organisms. The only satisfactory treatment is prophylaxis. It should be possible to avoid these cases. If in an emergency a rigid technic is not possible, spinal analgesics should not be used.

Boiler Cleaning and Dust Inhalation.—The investigation carried out by Channell showed that dust is produced in large quantities during the cleaning of boilers. Dust masks are essential to protect boiler cleaners. The type obtained for trial has proved very satisfactory. A single analysis of boiler tube deposit showed that it contained a high percentage of metallic copper and small amounts of metallic oxides, notably lead. If inhaled, these metals are detrimental to health. Further analyses of boiler deposit are required to confirm the constant presence of these constituents. Protective clothing would increase the comfort of working conditions. Eye shields are admirable for the protection of the eyes. The incidence of upper respiratory infections appears to be higher in boiler cleaning personnel.

The Patient: Neglected in Medical History.—Guthrie pays tribute to some patients of the past who have played an important part in medical progress. The patient's name is mentioned in many of the descriptions of wonderful cures in the Greek temples of Esculapius. Hippocrates, though entirely free from this boastfulness, mentions the names of many patients. The contribution of the patient is passive, and few patients, even if they happen to be also medical men, are concerned with the benefit to humanity which may accrue from their sufferings. The author mentions Beaumont's patient Alexis St. Martin and Mrs. Jane Todd Crawford, on whom Dr. Ephraim McDowell performed the first ovariectomy. Louis Pasteur gave full credit to his patients for the part they played in the fight against rabies. The story of the Alsatian boy Joseph Meister, who was attacked by a mad dog, is well known. On May 14, 1796 Jenner inoculated James Phipps, a boy 8 years of age, with cowpox from the hand of Sarah Nealmes, a milkmaid. There have always been doctors who did not hesitate to experiment on themselves in the interests of science; men like John Hunter, who shortened his life by an unfortunate effort to investigate the cause of syphilis. Lazear, Adrian Stokes and Noguchi died of yellow fever, Ricketts of typhus, Dutton of trypanosomiasis, and there have been many other martyrs to science. Banting related that the first patient to be treated with insulin, in 1922, was Dr. Joe Gilchrist. In the category of self experiment may be placed Manuel Garcia, the singing master who was curious to see his own vocal cords and who invented the laryngoscope in 1854, although he had no idea then that he was founding a new medical specialty. Among the patients whose influence has been of a negative character Guthrie mentions "typhoid Mary."

Nonulcerative Duodenitis.—Duodenitis is to be differentiated from ulcer of the duodenum as gastritis is differentiated from gastric ulcer. Dyspeptic, pseudoulcerative and hemorrhagic duodenitis can be diagnosed by clinical features, but the diagnosis of duodenitis is difficult. Serial roentgenograms may clarify the diagnosis and may aid in the differential diagnosis from ulcer. Oury and Vernet do not agree with many radiologists and clinicians that any deformity of the bulb is a definite sign of ulcer. The authors emphasize that only a niche on the lesser or greater curvature is characteristic of an ulcer. Rarely the niche may be visualized at the base. In the absence of a niche, additional important signs of ulcer are an incisura caused by spasm, pseudodiverticula from a juxtapyloric ulcer, a true bulbar biloculation and a deformity of the bulb. In contrast to this, duodenitis presents a hazy bulbar contour in the absence of a niche, rapid variations in the configuration of the deformity and difficulty in filling and emptying of the bulb, with irregular indented borders. Medical treatment is to be preferred to surgical treatment. The treatment consists in a strict prolonged diet of milk, vegetable soups, semolina and tapioca soups, to which are added toasted bread, stewed fruit, lean meat and lean fish. Rest is helpful. Administration of 5 Gm. of bismuth

subnitrate before meals and tincture of belladonna, 30 drops as the total daily dose, is recommended. In belladonna resistant cases good results were obtained by intravenous injections of atropine. Subcutaneous administration of solution of parathyroid combined with intravenous injections of calcium gluconate was effective in cases of pseudoulcerative duodenitis. Administration of vitamin A and D is favored.

Capillary Resistance in Human Subjects.—Frischknecht found that the suction procedure (principle of Hecht, 1907) is superior to the pressure method (principle of Rumpel-Leede, 1911) in determining capillary resistance. He determined the critical pressure values in 15 cases with a 2 cm. suction bell and compared these values with results obtained with a 1 cm. suction bell. The measurements were made in three regions: supraclavicular, infraclavicular and cubital. It was found that a person can show pathologic values in the clavicular regions and normal values in the cubital region or vice versa. A constant relation between the critical pressure obtained with the 2 cm. or 1 cm. bell was not observed. The critical time is not a suitable measure, but the critical pressure is the optimal measure for capillary resistance in that fluctuations of the clinical pressure parallel the clinical course of hemorrhagic diathesis. A single determination of capillary resistance obtained with the suction method frequently gives less information than the stasis experiment of Rumpel-Leede, since the normal values of the critical pressure vary greatly. The aim of the suction method is not the determination of the absolute capillary resistance but control of the fluctuations of the resistance during the action of various stimuli. This can be ascertained by daily determination in the supraclavicular region of the critical pressure, which is that negative pressure (measured in millimeters of mercury) which produces one to two petechiae in one minute suction time under a bell 2 cm. in diameter.

Serum Therapy of Appendicitis.—Bartels and Manicus-Hansen compared the results of operations for acute appendicitis during the decade from 1931 to 1940, in which serum therapy was practiced, with those of 1921 to 1930 without serum therapy. During the period without serum therapy 490 operations were performed with 48 deaths, as compared with 902 operations with 28 deaths during the period in which serum therapy was employed. The number of cases of peritonitis was nearly the same within the two periods. Accordingly, differences in the severity of the cases cannot possibly have played any part in the decrease of the mortality rate within the period during which serum therapy was employed. Adults generally received 20 to 25 cc. of anti-gas gangrene serum and 25 cc. of anti-coli serum. Children received correspondingly smaller doses. Intravenous administration of serum was performed at the end of the operation. Larger doses were given in severe cases. The injections were repeated during the first few days after the operation. The serum is not only a "peritonitis serum." It should also be given as a prophylactic measure in gangrenous cases and in cases in which the disease is of more than forty-eight hours' duration.

Book Notices

Bacillary Dysentery, Colitis and Enteritis. By Joseph Felsen, B.A., M.D., Director of Medical Research, Bronx Hospital, New York. Cloth. Price, \$6. Pp. 618, with 144 illustrations. Philadelphia & London: W. B. Saunders Company, 1945.

For many years in the temperate climes bacillary dysentery was regarded as being either nonexistent as a clinical entity or characterized only by occasional sporadic epidemics. That *Public Health Reports* constantly reported, month by month, the recurrence of occasional cases of dysentery seemed of no moment or consequence and was generally ignored. The author of this book has been one of the foremost proponents of the thesis that carriers of this dreaded disease were always among us, that epidemics were of frequent occurrence and that the chronic form of bacillary dysentery was constantly to be observed. The further theory that dysentery was in a direct manner associated with ulcerative colitis and even enteritis was his particular thesis, one which in past years he has labored hard to establish. By the collaborated studies of the International and the Pan American Dysentery Register he has had an unusual opportunity to collate all this material in a well written, readable, interesting and well documented volume.

The prose style of the book is excellent; the references are innumerable, accurate and extremely up to date. The typography, the paper, the illustrations, are excellent and well reproduced.

The historical aspects of bacillary dysentery are well analyzed; the momentous effects of such epidemics in terminating military campaigns, rather than the force of arms, are startlingly portrayed and are only now to be appreciated after the recent armed struggle, in which for the first time in history epidemics of disease were notably absent.

The epidemiology and the clinical aspects of epidemic and endemic bacillary dysentery are described with true clinical instinct, and the underlying bacteriology and serology, confusing as it is with its various and varying classes and nomenclature, are depicted in relative simplicity. The book, in this respect, fulfils a long-needed want for the general reader.

By including chronic ulcerative colitis and chronic distal ileitis as subtitles of bacillary dysentery, the author begs his question and presupposes the etiologic relationship of the two or more clinical entities. The latter part of the book is an attempt to define and to defend this hypothesis. Some confusion arises when in the statistical treatment of etiology the author constantly refers to "diarrhea, enteritis and dysentery" as if they were all one. Statements that chronic dysentery can be differentiated from ulcerative colitis by means of the sigmoidoscope run counter to the oft expressed opinions of many of our foremost authorities. The absolute clinical significance which the author grants to low titers of serum agglutination is also much mooted and less acceptable to many bacteriologists and clinicians. The fact that diagnostic titers were obtained in 93.5 per cent of cases of ileitis and colitis is a striking statement.

Regardless of whether one agrees in whole or in part with the thesis of the author, the book contains an orderly presentation of all the facts to date, clearly and lucidly laid out, arranged with precision and scientific discrimination, a volume which is both literary and provocative and essential reading for internists and specialists, who will see this problem grow in importance and magnitude, rather than recede, in coming years.

Bacillary dysentery is unquestionably among us at all times, and the relationship of the disease to the growing problems of colitis and ileitis deserve the very close study which this volume has devoted to the problem.

Introduction to Diseases of the Chest. By James Maxwell, M.D., F.R.C.P., Assistant Physician and Demonstrator of Practical Medicine, St. Bartholomew's Hospital, London. Second edition. Cloth. Price, 12s. 6d. Pp. 292, with 66 illustrations. London: Hodder and Stoughton, Ltd., 1945.

This edition of Dr. Maxwell's book has been brought up to date in several respects, yet it is shorter and contains fewer illustrations than the first, which was reviewed in these columns in 1939.

The book is divided into four sections and thirty-six chapters followed by the illustrations, which are individually captioned and referred to in the text. Sections I, II and III deal with the fundamentals of diagnosis of chest diseases. The history is concisely developed by discussion of major symptoms, minor symptoms and auxiliary data. Emphasis is placed on the major symptoms of chest disease in this first section and they are often referred to in subsequent chapters.

Dr. Maxwell has done an admirable piece of work in his presentation of the principles of physical examination of the chest. Emphasis has been placed on careful inspection of the entire patient and then inspection of the chest before any further examination is made. In a concise and clear manner the technique of palpation, percussion and auscultation is described. Similarly the significance of the physical findings is described in a manner making this section valuable particularly to the student and a refresher for the practitioner.

Attention should be drawn to the summaries concluding the chapters on physical examination. Likewise section III, on special investigations, clearly describes sputum studies, the value of hematologic studies and examination of the pleural fluid. Chapter II, on radiology of the chest, is well written and contains a wealth of information. It is good to see emphasis given to the place held by thoracoscopy and exploratory thoracotomy in chest diagnosis.

Chapters xiii to xxxvi in section IV deal with diseases and conditions of various parts of the respiratory tract. It is enlightening to find a work on chest diseases in which diseases of the upper respiratory tract and larynx precede any discussion of bronchopulmonary disease. Reference is made in the chapter on bronchiectasis to the influence of upper respiratory infection on bronchopulmonary function and disease.

The chapter dealing with asthma is well written and develops several factors any one of which may be the stimulus setting off the asthmatic syndrome. These factors are (1) allergic, (2) nasal, (3) bronchopulmonary, (4) alimentary, (5) endocrine and (6) psychologic. Their interrelation is stressed. Other chapters dealing with chest injuries, pulmonary circulation, emphysema, lung abscess, pleurisy, empyema, pulmonary tuberculosis and tumors of the bronchi and lungs are clear descriptions of these entities, their diagnosis and treatment.

More elaborate information on and discussion of silicosis, other industrial pulmonary diseases and some of the less common chronic lung infections would be welcome. This would, of course, enlarge the text.

Dr. Maxwell's consideration of the treatment of pulmonary tuberculosis is sound and conservative, and a brief discussion of surgical procedures is presented.

This small volume contains a wealth of material. The author has wasted no words but rather has presented his subject so directly and concisely that both the student, the general practitioner and the specialist may all find here the meat of an important subject.

The Care of the Neurosurgical Patient Before, During and After Operation. By Ernest Sachs, A.B., M.D., Professor of Clinical Neurological Surgery, Washington University School of Medicine, Saint Louis. Cloth. Price, \$6. Pp. 268, with 177 illustrations. St. Louis: C. V. Mosby Company, 1945.

This little book will be a source of pleasure to every one interested in neurologic surgery. It was written by one of the pioneers and masters of this field of surgery. As the title indicates, it is primarily concerned with the actual care of the patients, although the questions of symptoms, signs and diagnosis are touched on. The major concern is with the preoperative preparation of the patient, the organization of the operating room, the choice and administration of the anesthetic, actual operative technique, the administration of fluids and the post-operative care of the patient. The book is intensely personal. Dr. Sachs has given us the benefit of his many years of experience. He has related in detail how his patients are cared for at Barnes Hospital. The book will prove a mine of information, particularly to young men just beginning their training in neurologic surgery. It is replete with details of those little things which mean so much in the satisfactory handling of a difficult situation and in achieving all of the comfort possible for the patient.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

RH FACTOR, ABORTIONS AND STERILITY

To the Editor:—I have been married for ten years and have no children. My wife has had three miscarriages. She is Rh negative. For the past four years she has been unable to conceive. Could the Rh factor be responsible for this as well as for the miscarriages?

Captain, M. C., A. U. S.

ANSWER.—The extensive data thus far accumulated have failed to show any etiologic connection between the Rh factor and repeated miscarriages or sterility. In any event, as many as 1 out of every 7 persons is Rh negative, so there is a strong possibility of coincidence in a case like this. Clinical complications occur only when those who are Rh negative become sensitized to the Rh factor (only 1 in about 30 becomes sensitized when exposed to Rh positive blood by transfusion or as a result of a pregnancy with an Rh positive fetus), and the state of being Rh negative is no cause for concern as long as sensitivity is absent. Reliable tests for Rh antibodies are now available which can be carried out on any patient's blood serum and will definitely establish whether or not one is sensitized to the Rh factor (Wiener, A. S.: Conglutination Test for Rh Sensitization, *J. Lab. & Clin. Med.* 30:662 [Aug.] 1945. Diamond, L. K., and Abelson, N. M.: The Detection of Rh Sensitization: Evaluation of Tests for Rh Antibodies, *ibid.* 30:668 [Aug.] 1945. Coombs, R. R. R.; Mourant, A. E., and Race, R. R.: Detection of Weak and "Incomplete" Rh Agglutinins: A New Test [Preliminary Report], *Lancet* 2:15 [July 7] 1945).

SUFFOCATION AND BLOOD CARBON MONOXIDE

To the Editor:—It was stated recently in connection with a death presumably caused by suffocation that, since no carbon monoxide was found in the blood fifteen days after death, the death could not have resulted from suffocation, as in suffocation there would be incomplete combustion of the tissue, and carbon monoxide would be found in the blood. In suffocation, does not death result from absence of combustion rather than from incomplete combustion? Even if any carbon monoxide was formed, would it not be found as carbon monoxide hemoglobin rather than as carbon monoxide gas? There were not any postmortem signs of carbon monoxide poisoning reported by the pathologist. Could carbon monoxide be found in blood fifteen days after death? Would not a negative test for carbon monoxide in blood be without significance in death by suffocation? How long after death could carbon monoxide hemoglobin be detected?

Francis L. Parker, M.D., Charleston, S. C.

ANSWER.—W. D. McNally of Chicago in his book on Toxicology, 1937, cites a case in which he found carbon monoxide in the tissues of a body examined one year after death. The literature on the subject is reviewed in C. K. Drinker's book on Carbon Monoxide Asphyxia, 1938. There a case is cited in which carbon monoxide was found two hundred and ten days after death. Its presence or absence in the exhumed body depends on several factors. For example, even in a patient resuscitated from near death by artificial respiration and ear-bogen (carbon dioxide 7 per cent and oxygen 93 per cent) the blood is not completely cleared of carbon monoxide for from twelve to twenty-four hours. This is because carbon monoxide diffuses into the tissues and is fixed by respiratory pigment in the liver, spleen, bone marrow and muscle, which releases the gas rather slowly. After death from carbon monoxide poisoning, diffusion to the surrounding air would be slow and would reach an equilibrium in an airtight coffin; this would not occur in the presence of air currents. If the body decays and is leached with water, presence or absence of carbon monoxide would depend on the extent of the decay and leaching. Thus the interpretation of a negative test for carbon monoxide in the blood or tissues of a body would depend on the conditions of the burial and the state of the body on being exhumed.

It is likely that, unless the blood vessels of a corpse have been perfused considerably before the embalming fluid is injected, the tissues will show the presence of carbon monoxide much longer than fifteen days. A thorough perfusing of the blood vessels of a person dying of carbon monoxide poisoning would remove most of the blood and some of the carbon monoxide from the tissues. The blood vessels then could be injected with embalming fluid and no carbon monoxide would be found in the con-

tents of the large blood vessels. In a case of this sort the so-called blood could be negative for carbon monoxide and the tissue content would be small. However, if the person had died of carbon monoxide poisoning and the corpse was not tampered with, then carbon monoxide should be present fifteen days after death in any blood found and in the tissues in significant amounts. The finding of a positive test of low concentration is not easy to interpret. Smoking may yield a carbon monoxide saturation of the blood of from 1 to 5 per cent. Also the embalming fluid may be saturated with carbon monoxide gas and cause a positive test, or blood may be removed from a donor, saturated with carbon monoxide and then injected into the corpse.

REFRACTORY MENOPAUSAL SYMPTOMS

To the Editor:—A woman aged 42, following a complete hysterectomy, developed surgical menopause symptoms while in the hospital. She has been receiving 40,000 to 60,000 rat units of estrogenic substances hypodermically and six proprietary estrogenic tablets daily. Despite this she still is uncomfortable and has menopausal symptoms. How high can I go safely with the estrogens hypodermically? Would there be any benefit if I were to give less estrogen and some lutein extract? No benefit has been noted from ovarian and pituitary extract tablets. I have been using both the oil ampules and the aqueous ampules, but the patient still complains of pain, and swellings develop at the site of injection even though the area is massaged.

M.D., New York.

ANSWER.—Apparently this patient is suffering from a severe menopausal syndrome which is extremely resistant to estrogenic therapy, since relatively large amounts of estrogens have been found ineffective in relieving the symptoms. Occasionally such patients are encountered, and it is usually found that there is an underlying psychic pattern which offers resistance to any form of medication. It is possible that the patient has a psychic disturbance which may require treatment apart from the endocrine therapy. That she may be an extremely high strung and suggestible individual is indicated by the fact that she reacts locally to the aqueous suspensions of estrogens which are without any chemical irritant.

The following treatment is recommended to determine whether or not the patient is simply resistant to estrogen therapy or has an underlying psychic disturbance: She should receive injections of 5 mg. of estradiol dipropionate or diethylstilbestrol dipalmitate once weekly for three weeks. If this does not produce a satisfactory therapeutic response there is no need to continue searching for the proper dosages of estrogens, since this dosage is ample for all such cases. The continuous powerful action of these two substances makes them the most effective estrogens available. If this therapy is not effective, psychiatric consultation is advised. If this is not feasible, sedation with phenobarbital, $\frac{1}{4}$ or $\frac{1}{2}$ grain (0.016 or 0.032 Gm.) three times daily, may be used in conjunction with estrogenic therapy. One other possibility remains: combination of the large dose of estrogens with 10 mg. of testosterone propionate at each injection, since occasionally it has been found that this therapy may work to advantage.

IRRITATION FROM USE OF CONTACT LENSES

To the Editor:—Will you kindly send information concerning the use of contact lenses by a patient with keratoconus? I am referring to such problems as methods of getting rid of excess mucus and causes of "steam" under the lens.

A. V. Carl, M.D., Danville, Pa.

ANSWER.—These difficulties are all due to irritation, which may be mechanical or chemical. Those due to mechanical irritation can be helped by a better fit to remedy pressure points or tight or loose fitting and thick edges. There is a tendency to increased tolerance as the contact glass is worn, so that one must not be discouraged by an initial reaction that comes on in half an hour to an hour during the first week or two of use. Fortunately, cases of keratoconus are among the more tolerant, less sensitive ones.

More difficult is the treatment of the chemical irritation. The lubricating solution may be of too low, more rarely too high, osmotic strength. Usually a solution isotonic with the tears equivalent to 1.4 per cent sodium chloride is best. The solution may not be sufficiently alkaline. Usually a pH of 8 to 8.8 is well tolerated. The clouding may be due (a) to the presence of mucus or other secretions and cells which find their way into the liquid lens between the cornea and the contact glasses or (b) to opacities forming in the cornea itself. The former disappear at once with a fresh clean solution. The latter disappear slowly in fifteen minutes or more, depending on how far they have progressed. Different buffer solutions must be tried, the concentration and the pH being varied and different chemicals being used, since there are idiosyncrasies—for example, some persons do not tolerate boric acid. If clouding occurs

after a definite period, say two or four hours, the patient should be instructed to change the solution about half an hour before the clouding usually takes place.

Formulas for buffer solutions:

A. Solution 1 (acid)	
Boric acid	12.4 Gm.
Sodium chloride	8.4 Gm.
Distilled water	1,000.0 cc.
Solution 2 (alkaline)	
Sodium borate anhydrous (equivalent to 36.2 Gm. of borax)	19.1 Gm.
Sodium chloride	11.7 Gm.
Distilled water	1,000.0 cc.

To obtain buffer of desired pH , these are mixed as follows:

pH	Solution 1	Solution 2
7.6	30	5.25
8.0	30	11.0
8.4	30	18.0
8.8	15	45.0

B. Solution 1	
Boric acid (anhydrous)	12.4 Gm.
Potassium chloride (anhydrous)	7.4 Gm.
Distilled water	1,000.0 cc.
Solution 2	
Sodium carbonate anhydrous	21.2 Gm.
Distilled water	1,000.0 cc.

To obtain buffer of desired pH , these are mixed as follows:

pH	Solution 1	Solution 2
7.6	30	1.5
8.0	30	2.5
8.4	30	4.0
8.8	30	6.5

CHRONIC INFECTIOUS MONONUCLEOSIS

To the Editor:—A boy aged 6 years has a positive heterophile antibody test for infectious mononucleosis. All other tests of the serum have been negative. General supportive measures are employed such as a high protein diet, crude liver extract and vitamins. I am concerned now as to whether or not the crude liver is indicated; I believe it is on a supportive basis. Also I should like suggestions as to the best way to get the proteins into his system and as to whether or not there are any specific vitamins supposed to be of benefit in conditions of this sort? There are signs of chronic inflammation of the liver—a mild hepatitis. In times past I have sometimes used sodium thiosulfate as an alternative. Would this drug have any special indication here? Would iodine benefit this patient? I have been cautioned against these drugs in view of the condition of the liver. Would convalescent serum be practical or applicable? Would immunotransfusions in small amounts be recommended? This case is rather protracted—now going into the seventh month. The patient seems to be holding up well, but the blood picture stays rather constant.

L. F. Valentine, M.D., North Platte, Neb.

ANSWER:—It is rather unusual for the abnormal blood picture and high heterophile antibody to persist for seven months in infectious mononucleosis. There is no specific therapy for this disease. Convalescent serum (Lassen, H. C. A., and Thomsen, S.; *Acta med. Scandinav.* 104:498, 1940) has been reported to be of benefit in the early stages in bringing down the fever and producing symptomatic relief, but the serum is not readily obtainable. Blood transfusions are not indicated unless there is a significant anemia. Reports on the use of immunotransfusions were not found. The combination of a high protein diet, brewers' yeast powder, acceptable multivitamin preparations and injections of crude liver have been recommended for the treatment of hepatitis but would have no specific effect on infectious mononucleosis. The protein content of the diet can be raised by giving supplements of oral amino acid mixtures (Aminoids, Arlington Chemical Company, or Amigen, Mead Johnson & Co.). Evidence is lacking that sodium thiosulfate or iodine would be beneficial in a case of this type.

PREGNANCY TEST AND ADMINISTRATION OF ESTROGENS

To the Editor:—What effect would the administration of diethylstilbestrol have on the Friedman test in a nonpregnant woman? Would large parenteral injections of theelin affect the accuracy of the Friedman test?

M.D., Chicago.

ANSWER:—The administration of estrogenic substances to a patient should not affect the accuracy of the Friedman test if the determination is made on the basis of the ovarian reaction in the rabbit which receives the injection of the patient's urine. This reaction consists in the development of hemorrhagic follicles in the otherwise small nonvascular rabbit's ovaries. Some laboratories utilize the development of hyperemia of the oviducts in the rabbit as an indication of a positive test for pregnancy in the absence of ovarian development. This reaction depends on the response to estrogens from the rabbit's ovaries or from the presence of estrogens in the urine. Obviously a patient who receives an administration of estrogens and who thus excretes

a certain amount of it may give a false test when it is determined by the response of the oviducts. Where the reaction depends on the ovarian response to the chorionic gonadotropins in the patient's urine there should be no alteration in the accuracy of the test when the patient has received theelin or other estrogens.

TREATMENT OF CRUSHED FINGER

To the Editor:—A patient had the distal end of his finger severely crushed. The distal phalanx was avulsed at the interphalangeal joint, and except for a small amount of soft tissue the crushed portion was all but amputated. The crushed tissue was sutured back in place with hope that there might be sufficient blood supply. The finger was splinted by the finger nail, which had remained in place, and by a tongue depressor which was incorporated in the dressing. In treating this case I ordered the extremity kept cold with an ice cop, for which I was criticized. The reason for ordering the cold treatment was to lower the metabolism in the distal end until a sufficient blood supply could be established.

Lieutenant (jg), (MC), U.S.N.R.

ANSWER:—The best results in cases such as that described are probably accomplished by a judicious combination of compression and rest. The surgeon who transplants a flap of skin and subcutaneous tissue is always concerned about its vitality. In this case the surgeon was dealing essentially with a flap with a meager blood supply. Such flaps, as Blair has pointed out, are more likely to die from congestion and failure of the return circulation than from lack of sufficient blood. The venous return is greatly handicapped, more so than the arterial inflow. Compression aids the return circulation and helps to prevent the congestion that leads to tissue necrosis.

There does not seem to be any logical reason for the use of ice in such a case. The surgeon who transfers a flap from one part to another would not employ cold applications, simply because cold arrests tissue metabolism and leads to devitalization of tissue. Arrest of tissue metabolism is simply the early stage of tissue necrosis.

TOXICITY OF PHOSPHORIC ACID IN INDUSTRY

To the Editor:—Will you kindly furnish me with information concerning the toxicity of phosphoric acid as used in factories for rust prevention.

R. G. Hickerson, M.D., Keithsburg, Ill.

ANSWER:—Phosphoric acid as industrially employed for fingerprint removal and rust prevention is not a likely source of injury to exposed workers. It is no more damaging to the skin than an equal concentration of other mineral acids. Phosphoric acid in dilute form is frequently used by oral administration therapy in such quantities as 10 cc. every hour for ten hours. Difficulties currently being experienced in industry from phosphoric acid mixtures used for antioxidation usually derive from the solvent of phosphoric acid, which in many instances is butyl cellosolve. This compound is ethylene glycol mono-n-butyl ether and is credited with being the most toxic of the compounds in its series. Early manifestations center about minor irritations of the eyes and respiratory tract, but in more severe instances there may be inflammation of the liver and kidneys associated with the hematuria. In animals the minimum lethal dose is about 0.5 cc. per kilogram of body weight. Its apparent toxicity is about five times as high as that of the better known ethylene glycol. Other substances suitable as solvents of phosphoric acid are likewise toxic in varying degrees.

CANCER AND MENTAL DISTURBANCES

To the Editor:—What investigation has been made of late years along the line of the effect of mental disturbances and their relation to cancer? I have been in practice over forty years, and my attention has been called many times to the development of cancer following long periods of mental worry over which the sufferer had no control.

Wordsworth M. Elliott, M.D., Durango, Colo.

ANSWER:—Medical literature does not appear to contain reports of close studies of the relation of mental disturbances to the causation of cancer. This is certainly true for late years. So far as known there are no reliable statistics on the relative frequency of cancer in sane and insane persons of the same ages and other comparable states. The reports of hospitals for the insane do not contain accounts of notably large numbers of cases of cancer in their populations. While there is no evidence at hand that "worry" of itself can induce cancer, it is well known that the fear of cancer, cancerphobia, may be associated with mental disturbance. Of course it is not to be denied that worry associated with more or less important disturbances of metabolism and health may appear to favor the development of cancer under certain conditions. The frequency in advancing years of cancer and of states of "mental worry" makes it obvious that the two conditions may occur coincidentally without any causative relationship.

SURGERY, GENERAL AND ABDOMINAL—Chairman, Daniel C. Ekin, Atlanta, Ga.; Vice Chairman, William D. Andrus, New York; Secretary, Alton Ochsner, 1430 Tulane Ave., New Orleans

OBSTETRICS AND GYNECOLOGY—Chairman, Philip I. Williams, Philadelphia; Vice Chairman, Francis B. Carter, Durham, N. C.; Secretary, William F. Mengert, 2211 Oak Lawn, Dallas, Texas

OPHTHALMOLOGY—Chairman, Frederick C. Cordes, San Francisco; Vice Chairman, Grady E. Clay, Atlanta, Ga.; Secretary, Robert J. Masters, 23 East Ohio St., Indianapolis

LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY—Chairman, Louis H. Clerf, Philadelphia; Vice Chairman, Henry B. Orton, Newark, N. J.; Secretary, Fletcher D. Woodward, 102 E. Market St., Charlottesville, Va.

PEDIATRICS—Chairman, John Aikman, Rochester, N. Y.; Vice Chairman, Henry G. Poncher, Chicago; Secretary, Gilbert J. Levy, 188 S. Bellevue Blvd., Memphis, Tenn.

EXPERIMENTAL MEDICINE AND THERAPEUTICS—Chairman, Edgar V. Allen, Rochester, Minn.; Vice Chairman, Carl A. Dragstedt, Chicago; Secretary, Dwight L. Wilbur, 237 14th Ave., San Francisco

PATHOLOGY AND PHYSIOLOGY—Chairman, Virgil H. Moon, Philadelphia; Vice Chairman, J. J. Moore, Chicago; Secretary, Frank W. Hartman, 2799 West Grand Ave., Detroit

NERVOUS AND MENTAL DISEASES—Chairman, Percival Bailey, Chicago; Vice Chairman, H. Houston Merritt, Boston; Secretary, R. P. Mackay, 8 S. Michigan Blvd., Chicago

DERMATOLOGY AND SYPHILIGOLOGY—Chairman, Clyde L. Cummner, Cleveland; Vice Chairman, Dudley C. Smith, Charlottesville, Va.; Secretary, Nelson P. Anderson, 2007 Wilshire Blvd., Los Angeles

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH—Chairman, E. I. Stebbins, New York; Vice Chairman, C. O. Sappington, Chicago; Secretary, W. A. Sawyer, 343 State Street, Rochester, N. Y.

UROLOGY—Chairman, Arbor D. Munger, Lincoln, Neb.; Vice Chairman, Lloyd G. Lewis, Washington, D. C.; Secretary, Grayson L. Carroll, 539 N. Grand Blvd., St. Louis

ORTHOPEDIC SURGERY—Chairman, Theodore A. Willis, Cleveland; Vice Chairman, Francis M. McKeever, Los Angeles; Secretary, J. Warren White, 206 E. North St., Greenville, S. C.

GASTROENTEROLOGY AND PROCTOLOGY—Chairman, J. Arnold Borgen, Rochester, Minn.; Vice Chairman, Martin S. Kleckner, Allentown, Pa.; Secretary, Sara M. Jordan, 605 Commonwealth Ave., Boston

RADIOLOGY—Chairman, Edwin C. Ernst, St. Louis; Vice Chairman, Bernard P. Widmann, Philadelphia; Secretary, U. V. Portmann, 2020 E. 93d St., Cleveland

ANESTHESIOLOGY—Chairman, Ansel M. Caine, New Orleans; Vice Chairman, Harold C. Kelley, New York; Secretary, John S. Lundy, 102 Second Ave. S.W., Rochester, Minn.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE
DEPARTMENT, SEPTEMBER—DECEMBER 1945

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals, except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1933. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "ab," abstracts; the star (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." State board examinations are entered under the general heading State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1340.

cord, transurethral operation, [Thompson] 833—ab
cystoscopy (large), treatment [Patel] 986—ab
cystometry, [Band] 94—ab
etiology of Hunner ulcer, [Powell] 529—ab
Fistula: See Fistula
function in early rising after childbirth, [Rosenblum & others] *852
neck obstruction (persistent) and infection, 916
Schistosoma hematobium infection, fuadin for, [Miller] *344
vesicoureteral reflux with renal colic, [Cor-donner] *662
BLAIN, DANIEL, director of neuropsychiatric services in Veterans Administration, 820
BLAST: See Explosions
BLEB: See Blister
BLEEDING: See Hemorrhage
BLINDNESS: See also Conjunctivitis, infections acute; Nerves, optic atrophy; Vision
Braille Institute of America makes first public appeal, 759
denial by patients with cerebral disease, [Redlich] 304—ab
Dunn (J. W.) memorial fund for blind 470—OS
rehabilitation of blind, N. Y., 82
war veterans, bill to provide seeing-eye dogs for, 969—OS
BLISTERS, epidermolysis bullosa in newborn, [Black & others] *734
vesiculopustular eczema, calamine lotion or Dailbour's solution for [Newton] 150—C; (reply) [Goodman] 707—C
BLOATING: See Flatulence
BLOOD: See also Hemo—
agglutination (congenital) cause of "bleed-ers," [Hendersou] 880—ab
alcohol concentration in, in diagnosis of intoxication, 853—ab
amylase, in chronic alcoholism, [Carter] 408—ab
Bacteria in: See Bacteremia
Bank: See Blood Transfusion
bilirubin, icterus index in posttransfusion hepatitis [Bernheim] 230—C
Blood—Journal of Hematology, 820
calcium increased, sign of hyperparathyroidism, [Keating & Cook] *994
carbon dioxide tension, hyperventilation studies, [Christensen] 1230—ab
carbon dioxide treated, in diagnosis of sickle cell anemia, [Winsor & Burch] *793
carbon monoxide, death from carbon monoxide poisoning or suffocation? 1295
Cells: See Erythrocytes; Leukocytes
chlorides, chronic hypochloremia simulating psychoneurosis, [Saphir] *510
Circulation: See Vasomotor System
Clot: See Thrombosis
Coagulation: See also Blood prothrombin
Coagulation, Anticoagulant: See also Blood preservation; Dicumarol; Heparin
coagulation, anticoagulant activity measured by F. E. Freitag, 1118
Conservation: See Blood preservation
content of pneumococcus antibodies in pleuris, [Heitzelmann] 174—ab
Donors: See Blood Transfusion
Dyscrasia: See Agranulocytosis, Acute; Anemia; Anemia, Pernicious; Leukemia; Polycythemia
fats, nephrotic hyperlipemia, [Hejmann] 951—ab
formation in pernicious anemia, [Japa] 711—ab
Groups: See also Rh Factor
groups and Rh factor frequencies in Japanese, [Graydon] 773—ab
groups, detection of agglutination A₂ [Young] 953—ab
groups O, transfusion reaction to, [Malkiel & Boyd] *314
groups, specific substances, Witteky A and B, to change types into "universal donor," *810; (reply) [Fridall & others] 1286—C
Hematology Research Foundation: Reader Fellowship, [Flannerman Fund] 1276
in spinal fluid after head injuries, [Friedman] 410—ab
Infection: See Bacteremia
Injection of Whole Blood or Its Derivatives: See Blood Transfusion
Loss of: See Hemorrhage
Menstrual: See Menstruation
Methemoglobin in: See Methemoglobinemia
nitrogen, determination, Kjeldahl method, [Soree] 712—ab
penicillin level after intramuscular and subcutaneous use, [Kirby & others] *910
penicillin level after oral use, [Finland & others] *316; *317; [Boss & others] *329
penicillin levels after using X and G type, [Ory & others] *257
phosphorus decreased, sign of hyperparathyroidism, [Keating & Cook] *994

BLOOD—Continued

Plasma: See under various headings of
 • Blood, Blood Transfusion; Serum
 Platelets See Purpura, thrombopenic
 Preservation: See also Blood Transfusion,
 blood banks
 Preservation, anticoagulant solution for, 484
 Pressure: See BLOOD PRESSURE
 proteins, origin of gamma globulins, [Ehrlich
 & Harris] 149—C
 protrombin, hypoprotrombinemic action of
 quinine sulfate (correction) 566
 protrombin in late secondary tonsillar hem-
 orrhage, [Nelvert] 575—ab
 protrombin time, asphlin—vitamin K un-
 warranted, [Higley] 1123—C
 quinuacrine in plasma, [Brown] 413—ab
 Rh Negative. See Rh Factor
 salicylates in rheumatic fever, [Wegria &
 Smull] *485, [Murphy] 1063—ab
 sedimentation in sickle cell anemia [Winsor
 & Burch] *793
 sedimentation rate in infective hepatitis,
 [Vites] 311—nb
 sedimentation, salicylate therapy in rheu-
 matic fever, [Wegria & Smull] *485
 Serum: See various subheads under Blood;
 Blood Transfusion, Serum
 Storage See Blood preservation
 streptomycin level, 1098—E
 Substitute. See Blood Transfusion
 Sugar See also Diabetes Mellitus
 sugar, hypoglycemic coma, 915
 sugar in dogs, effect of alloxan on, 145
 sugar, rise in skin sugar without hyper-
 glycemia, [Urbach] *438
 sugar, saccharin will not raise, 652
 thioracil levels, [Paschke] 169—ab
 Transfusion. See BLOOD TRANSFUSION
 Type See Blood groups
 Universal. See Blood groups
 Vessels. See BLOOD VESSELS
 vitamin C in chest surgery, [Zerbini] 832
 —ab
 volume determinations with radioactive phos-
 phorus, [Nylén] 412—nb
 whole or citrated, [Dieckmann] 151—C
BLOOD PRESSURE, high, acetylcholine dan-
 ger in, [Danielopolu] 414—ab
 high, adrenal cortex relation to, [Perera] *537
 high, cytochrome oxidase effect on hyperten-
 sion and hypophysis, [Cruz Coke] 95—ab
 high essential, effects of air travel on
 patients, 1232
 high essential, kidney function in, [Isberg]
 770—ab
 high essential, prognosis, indications for op-
 erative treatment, [Rasmussen] 913—ab
 high, factors which predispose to, 177
 high, in Army officers, [Hillman & others]
 125: *699, [Levy & others] 126: *829,
 128: *1059, 129: *587
 high, pressor activity in urine, [von Euler]
 1230—ab
 high, salt restricted diet for [Grollman &
 others] *533
 high, sodium thioeyanate for, 145, [Bcamish]
 983—ab
 high, sympathectomy in, effect of exercise,
 [Lord & Hintou] *1156
 high, venatrum uride for, [Harkins] 481—ab
 low, [Hamilton] 237—ab
 low, acetylcholine for, [Danielopolu] 414—ab
 responses (simulated) in lie detector tests,
 1099—E
 venous, pulmonary embol production [Chap-
 man & Linton] *196
BLO anemic heart,
 Army Medical Service
 test for Rh negative blood, [Tisdall &
 Garland] *1079
 Blood Banks See also Blood preservation
 blood banks (Bureau report), 632—OS, (ex-
 change bank, N Y) 701, (building for
 Seattle) 1217
 blood banks, distribute plasma and other
 blood products, Mass., 894
 blood bank, distribution by Red Cross of sur-
 plus dried blood plasma, 1175—OS, [Mc-
 Glines] 1275—OS
 blood banks, named for physician who died
 in action Capt McGee, 972
 blood donor (universal), Whiteky A and B
 group specific substances to covert types,
 840, [Tisdall] 1286—C
 blood donors (ineligible) list prepared for
 traveling Red Cross blood bank unit, 532
 blood donor program (new), Mass., 1216
 blood donors, thrombophlebitis of cubital
 veins in, [Zukerman] 1229—ab
 cord transfusion in premature infant with
 erythroblastosis fetalis, [Harville] *801
 malaria, hazards after war, [Rubenstein]
 832—ab
 of blood substitute. Perliston, 899
 of blood substitutes: gelatin solution,
 [Steigmann] 573—ab
 of group B plasma, [Tisdall & others] 1286
 —C
 of heated blood with epinephrine and glucose
 added in azeal and clinical death,
 [Negorsky] 1226—C

BLOOD TRANSFUSION—Continued

of Rh positive blood to Rh negative patient,
 anti-Rh agglutinins develop after, [Drum-
 mond] 94—ab
 of transfused erythrocytes of stored blood,
 [Altman] 712—ab
 of whole or citrated blood, [Dieckmann] 151
 —C
 physician's responsibility in France, 644
 reaction due to a dangerous universal donor,
 [Makiel & Boyd] *344
 reactions hepatitis in battle casualties, human
 immune serum globulin in prevent, [Gross-
 man & others] *991
 reactions, hepatitis, use of leterus Index,
 [Bernheim] 230—C
 service, operation, Inva, 1276
 simultaneous with sulfonamides not contra-
 indicated, 584
BLOOD VESSELS. See also Arteries, Capil-
 laries, Vasomotor System, Veins
 Disease See also Arteriosclerosis; Cardio-
 vascular Disease. Raynaud's Disease,
 Thromboangiitis obliterans
 disease, relation to adrenal cortex [Perera]
 *537
 of muscles and gas gangrene, [Power] 171
 —ab
 roentgen study, intracranial angiography,
 [List] 480—ab
 surgery, physiologic considerations, [Rogers]
 413—ab
BLOODLETTING, origin of barber pole, 261—ab
BLUE CROSS PLAN. See Hospitals, expense
 insurance
BOARD See under specific names ns American

OPHTHALMOPLAGIA: See Eyes, paralysis

OPIE, EUGENE L., Parkes Weber prize for, 1319

OPIUM: See also Morphine

total prohibition in Far East by British, 898

OPTIC Atrophy: See Nerves, optic

OPTOMETRY corps in Army Medical Dept., legislation on (Bureau report), 637—OS

ORAL CAVITY: See Mouth

ORANGE juice, Donald Duck, Priceless, and Seidswell, 873

pudding, Heinz strained, 551

ORATIONS: See Lectures

ORBIT tumors, transcranial removal, [Love & Benedict] *777

ORCHITIS: See Testis Inflammation

ORDER of the Purple Heart: See World War II, Heroes and Prisoners

of Physicians, France, 821

OREGON, county summary sheet on physician supply not yet received, 80—OS

ORGANIZATIONS: See also Societies, Medical; list of Societies and other Organizations at end of letter S

defect, list from Chose National Bank, 352—nb

ORGANIZED Medicine: See American Medical Association; Societies, Medical

ORIENTAL Sore: See Leishmaniasis, cutaneous

ORNTHOSSIS: See Psittacosis

ORPHANAGES: See Children

ORTHOPEDECS surgery, intravenous anesthesia using penicillin sodium for, [Thomas] *789; (correction) 1218

surgery, survey of facilities for training in, [Glimmer] *35

ORTHOPTICS, practice by nonmedically trained persons (technicians), 1133

treatment of strabismus, [Gilian] 1130—ab

OSTEOCHONDRIITIS, Köhler's disease, of tarsal scaphoid, 840

OSTEOMA, disseminated congenital, of skin, [Vero & others] *728

OSTEOXYELITIS, acute, penicillin for, [Altmeier] 480—ab

of skull; penicillin for, [Schmiller] 649—ab

OSTEOPATHS, air embolism fatal after insufflation by, during pregnancy, [Breyer, foyle] *342; (correction) 643

airplane pilots examined by, 75—E

defeated in injunction proceedings over EMIC program, Tex., 83

OSWALDO Cruz Institute: See Cruz

OTITIS MEDIA, chronic catarrhal, vitamins and neosilimine for deafness, 888

treatment, penicillin, [Aliman] *109; [Weinstein & Altherton] *303; (locally) [Woodward & Holt] *590

OTOLARYNGOLOGY, Pan American Congress postponed, 224

OTOLOGY, penicillin intramuscularly, [Allman] *109

ns, 416

ns, 416

South American

Ovary: See also Corpus Luteum

hypofunction, response to equine and chorionic 1062—ab

with equine gonadotropin, 27—ab

reaction in, [Thomson] 986—ab

OVERWEIGHT: See Obesity

OXIDATION, function of vitamin E, 1019—E

OVIDUCTS, death from air embolism after insufflation during pregnancy; [Breyer] *342; (correction) 643; (question of priority) [Mortland] 905—C; (use of speculum to apply powder) [Trager] 905—C

patency and fertility, 416

patency tests: insufflation and roentgen study, [Miller] *243

OXIDIZED cellulose, absorbable gauze (cellulosic acid), [Frantz & Lattes] *798

OXOPHENARSINE HYDROCHLORIDE (maparsen), acute agranulocytosis from, sulfadiazine for, [Tarnow] 307—ab

accidental intra-arterial injection, [Walsh & Venturi] *1255

OXYGEN deficiency, noxia, role in myalgia or arthralgias, bends, 714

deficiency, effects on heart muscles, 1117

deficiency, renal syndrome from renal anoxia, [Macgrath] 1130—ab

discovery of, 9—ab

Quotient: See Metabolism, basal

tank (portable) for use in aerosol penicillin method, [Vermilye] *250

tent, Heidbrink, 551

PACIFIC, War in: See World War II

PADEREWSKI memorial work continues, Edinburgh, 643

PAIN: See Abdomen; Backache; Dysmenorrhea; Headache; under specific organs or regions as Abdomen; Muscles

PAIN—Continued

Burning: See Causalgia
Preordial: See Angina Pectoris; Thrombosis, coronary
Relief of: See Anesthesia
PAINTING: See Art
PALESTINE, foreign letter from, 144
medical school proposed, 613; (Abraham Flexner heads scientific sponsors) 973
PALETTE, EDWARD M., death of A. M. A. Board of Trustee member, 692—OS; (portrait) 918
PALM: See Hand
PALSY: See Paralysis
PALUDRINE, new British antimalarial drug, 1219

PAN AMERICAN: See also Inter-American; Latin American
Congress of Ophthalmology, (meeting) 224; (airlines reduce fares to) 525
Congress of Otolaryngology postponed, 224

PARONYCHIA, photosensitization from handling, [Stark] 173—ab

PARTITION: See Labor
PASTURELLA tularensis Infection: See Tularemia

PATENT MEDICINES: See Nostrums
PATENTS, Varnegar Bush report, 418—E; 466—OS

PATENTS—Continued

Wiseonsin Alumni Research Foundation, for vitamin K-aspirin mixture, [Higley] 1123—C

PASTEUR, LOUIS, 50th anniversary of death, 1221

PATHOLOGIST, American, honored: Dr. Ople, 1219

PATHOLOGY: See also Disease
Asehoff's RUDOLF VERNHOF: WISSENSCHAFT UND WELTGEFÜHRUNG, [Plaut] 1122—C
cellular, Klemperer's review, 75—E
chemical, teaching and practice: Goodenough report, England, 225

PATIENTS: See also Disease; Hospitals; Medical Service; Surgery; under names of specific disease
Paralysis Chronically ill: See Disease
Convalescence: See Convalescence and Convalescents
neglected in medical history, [Guthrie] 1293—ab

time physicians spend with, 877—E
Transport of: See Ambulances

PAUL-Lewis Laboratories Inc., award in enzyme chemistry, 820

PAY: See Earnings

PEANUT oil-beeswax, penicillin in, [Kirby & others] *910; 1133

PEARS, Beech-Nut strained; also with pineapple, 131

PEARS, ROBERT A., appointed to A. M. A. Board of Trustees, 693

PELLAGRA and senile psychosis, [Meyersburg] 619—ab

electrocardiographic changes and niacin in, [Hachmehl] 415—ab

In U. S., 1019—E

infantile, hepatic damage in; vitamin, liver and dried stomach therapy, [Gillman & Gillman] *12

infantile, powdered stomach in treatment of fatty liver, steatorrhea and edema of, [Gillman] 982—ab

prevention; corn grits increases nicotinic acid need, 73—E

relation between corn grits, niacin, tryptophan, protein and intestinal bacteria, 874—E

vitamin B imbalance, 74—E

PELVIS, cancer, committee to study, Philadelphia, 293

tumors, disarticulation of innominate bone for, [Sugarbaker] 170—ab

PEMPHIGUS: See also Epidermolysis bullosa
foliaceus, 1281

PENICILLIN, absorption from body cavities, [Florey] 482—ab

action on staphylococci, [Cibain] 238—ab; [Himmelmelt] 836—ab

aluminum, intramuscular injection, [Bohls] 911—ob

antitoxic action, 1263—E

autolytic enzymes in bacteriolysis by, [Todd] 912—ab

benzyl, 534—E

calcium, dissolved in beeswax peanut oil, 1133

calcium, N. N. R., (Pfizer) 517; (Merek) 1255

discovery, Fleming visits Paris, 822

discovery, Nobel prize to Drs. Fleming, Florey and chain, 743—E

G compared with penicillin X, [Ory & others] *257

In Blood: See Blood

legislation on (Bureau report), 637—OS

nonexcretion in bovine milk, 134—E

preparations containing beeswax, [Bunn & others] *324; [Kirby & others] *940; 1133

preparations, Delacillin; also oral and topical products, 1133

research by New Britain General Hospital, 563

sensitivity of common pathogens, [Meads] 981—ab

sensitivity of staphylococci, [North] 837—ab

sodium, N. N. R. (Warner) 32; (Lake-Idle) 211; (Smith-Dorsey) 517; (Merek) 1255

supply, distribution unit no longer operating, 820

supply, effectiveness of different manufacture, 985

supply, hospitals get first call, 892—OS; 1038; 1031—OS

supply, manufacture in India, 1279

supply, production, 1115

supply, regulations governing orders, 1033

supply, released from war controls, 80—OS

supply, shortage, 874—E; 892—OS

PENICILLIN—Continued

Treatment: See also Abscess, perirenal; Agranulocytosis, Acute; Asthma; Breast inflammation; Bronchus infections; Cardiovascular Disease, syphilis; Diptheria carriers; Endocarditis; Frambesia; Gonorrhea; Impetigo neonatorum; Lungs abscess; Lungs infections; Mastoiditis; Meningitis; Mouth, cellulitis of floor; Neurosyphilis; Osteomyelitis; Otitis Media; Pneumonia; Relapsing Fever; Sinusitis; Skin disease; Stomatitis, gangrenous; Syphilis; Trachoma treatment, aerosol, in general practice, [Vermilye] *230

treatment, continuous intravenous drip, [Loewe] 981—ab

treatment, cream in syecosis barbae, [Burrows] 412—ab

treatment, higher dosage in severe necrotic lesions, [Naide & Sayen] *869

treatment, in beeswax-peanut oil, intramuscular and subcutaneous use, [Kirby & others] *940

treatment in ophthalmology, 974

treatment, inhalation, [Vermilye] *230

treatment, intra-arterial injection, 1281

treatment, intramuscularly, in otology, [Allman] *109

treatment, intratracheal, [Kay & Meade] *203

treatment, intratracheal, for infected bronchiectasis, [May] 650—ab

treatment, local, (drops, spray, lozenges or lozenges) [Woodward & Hilt] *389

treatment, local, in ophthalmia neonatorum, [Sorsby] 650—ab

treatment, local, of renal carbuncle, [Shearer] 909—ab

treatment, nebulized, in respiratory tract infections, [Hanks] 911—ab

treatment of chronic prostatitis with sodium salt, 484

treatment of empyema, limitations, [Poppe] *435

treatment of gonorrhea, secondary syphilis after, [Atcheson] 408—ab

treatment, oral, [Finland & others] *315; [Ross & others] *327

treatment, oral and topical products stable? 1133

treatment, oral, of gonorrhea, [Cutting & others] *423

treatment, oral, of pneumonia, [Bunn & others] *320

treatment plus heparin in endocarditis, [Grolnick] 470—ab

treatment, solution, suction device for keeping in contact with wound, [Crile] *207

treatment, spray and intramuscular, of scarlet fever, [Meads & others] *785

treatment, sternal infusion, intravenous and intramuscularly, in endocarditis, [Ellipin & others] *811

treatment, streptococcal resistance to altered, [Bloomfield & Halperin] *1138

treatment, transverse myelopathy after recovery from meningitis, [Sigal] *547

treatment, value in preventing congenital syphilis, 1232

X, comparison with penicillin G, [Ory & others] *237

why trade names for antibiotics? 534—E
